TPH-d	total petroleum hydrocarbons quantified as diesel fuel
TPH-g	total petroleum hydrocarbons quantified as gasoline
VOC	volatile organic compound

SECTION 1

Introduction

CH2M HILL Engineers, Inc. (CH2M) prepared this groundwater monitoring report on behalf of SFPP, L.P. (SFPP), an operating partnership of Kinder Morgan Energy Partners, L.P. (Kinder Morgan), and Defense Logistics Agency (DLA) Energy to summarize the results of groundwater monitoring activities conducted at the Defense Fuel Support Point (DFSP), Norwalk, California (site) during the first half of 2016. The site location and vicinity are shown on Figure 1.

The results documented in this report are based on groundwater monitoring that has been conducted in accordance with revised sampling and analysis plans prepared by SFPP (CH2M, 2013) and DLA Energy (Parsons, 2013). The Regional Water Quality Control Board, Los Angeles Region (RWQCB) approved the sampling plans on June 27, 2013, and October 23, 2013, respectively (RWQCB, 2013a, 2013b).

SFPP and DLA Energy jointly perform groundwater monitoring events at the site to address respective impacts to groundwater by each entity. SFPP contracted CH2M to perform project oversight of groundwater monitoring activities; DLA Energy contracted The Source Group, Inc. (SGI) to perform project oversight of groundwater monitoring activities. SFPP contracted Blaine Tech Services, Inc. (Blaine Tech) to gauge and sample the designated SFPP wells, and SGI personnel conducted the gauging and sampling for DLA Energy. CH2M was retained by SFPP to compile and interpret the data from these sources and prepare this summary report.

Since 1986, environmental assessments have been performed at the DFSP facility (both onsite and offsite) by several consultants on behalf of SFPP and DLA Energy. During these investigations, wells were installed for monitoring and as components of groundwater remediation activities. Table 1 presents a summary of groundwater monitoring and remediation wells associated with the site. These investigations evaluated and defined the extent of liquid-phase, adsorbed-phase, and dissolved-phase hydrocarbons in soil and groundwater beneath the site and offsite to the south, east, and west.

Site assessments identified the following principal constituents of concern at the site:

- Total petroleum hydrocarbons (TPH), including TPH quantified as gasoline (TPH-g), diesel fuel (TPH-d), jet propellant 4 (JP₄), jet propellant 5 (JP₅), and jet propellant 8 (JP₈)
- Benzene, toluene, ethylbenzene, and total xylenes (BTEX)
- 1,2-dichloroethane (1,2-DCA)
- Methyl tertiary butyl ether (MTBE)
- Tertiary butyl alcohol (TBA)

Additional background information regarding investigations and monitoring events at the site is presented in previously submitted semiannual groundwater monitoring reports. Monitoring wells and remediation wells are monitored on a semiannual basis to evaluate groundwater elevation and groundwater quality conditions at the site.

In December 2014, DLA Energy decommissioned 28 wells across the site to facilitate ongoing soil excavation (source removal) activities. The wells were located within the footprint of the proposed excavation areas and were, therefore, proposed to be decommissioned. Of the 28 wells decommissioned, the following 13 wells were monitoring or extraction wells, included in the RWQCB-approved Monitoring and Reporting Program:

- DLA Energy Wells: GMW-17, GMW-32, GMW-35, GMW-66, GW-14, TF-9, TF-17, and TF-20
- SFPP Wells: GMW-4, GMW-14, GMW-27, GWR-1, and MW-15

SECTION 1 – INTRODUCTION

Consequently, no groundwater analytical or elevation data for the April 2016 event are presented for these wells in this report. After soil excavation activities are complete, DLA Energy has agreed to replace these wells at their original locations or at locations approved by the RWQCB. These wells will be monitored on a semiannual basis thereafter.

In addition, SGI and Blaine Tech did not gauge or sample the following wells in April 2016 because the wells either could not be located or accessed as a result of ongoing soil excavation activities:

- DLA Energy Wells: GMW-5, GMW-12, GMW-16, GMW-18, GMW-19, GMW-31, GMW-40, GMW-41, GMW-42, GMW-43, GMW-44, GMW-45, GMW-48, GMW-54, GMW-56, GW-1, GW-6, GW-7, GW-8, MW-28, TF-15, TF-21, and TF-24.
- SFPP Well – GMW-3

Once these wells become accessible, they will be gauged and sampled in accordance with the revised Monitoring and Reporting Program during future semiannual events.

This report furnishes information pertaining to the April 2016 Semiannual Groundwater Monitoring Event and includes groundwater gauging and sampling data from selected wells throughout the DFSP site and from wells located offsite to the south, east, and west. It also provides an updated description of the status of the dissolved-phase and liquid-phase hydrocarbon plumes. Two separate groundwater monitoring events were performed in the south-central area during March and June 2016, as part of SFPP's biosparge well pilot testing program. The March 2016 data are presented in Appendixes A and B of this report; June 2016 data were not available at the time of report preparation. A discussion of this pilot test data will be provided in an evaluation report that will be submitted to the RWQCB under separate cover.

SECTION 2

Field and Laboratory Activities

An overview of the semiannual monitoring event is provided in Section 2.1. Field and laboratory methods are described in Section 2.2.

2.1 Semiannual Groundwater Monitoring

Groundwater levels were gauged and samples collected as follows:

- SFPP wells were gauged by Blaine Tech on April 11, 2016.
- DLA Energy wells were gauged by SGI April 11 through 14, 2016.
- Additional wells were gauged by SFPP on April 12, 2016, because access to these wells was not available to Blaine Tech (Table 3).
- SFPP and DLA Energy wells were sampled by Blaine Tech and SGI, respectively, from April 11 through 15, 2016.

Overall, 135 water levels were measured in 139 wells (7 wells were dry; EXP-1, EXP-2, and EXP-3 were gauged twice), and 91 of those wells were sampled, for a total of 94 samples (3 split samples were included for EXP-1, EXP-2, and EXP-3). Sampling was conducted using low-flow methods as described in Section 2.2. EXP-1, EXP-2, and EXP-3 were gauged and sampled by SGI on behalf of DLA Energy and SFPP. Table 2 lists the wells that were gauged and the results during the first semiannual 2016 event. Table 3 lists the wells that were sampled and the results for the first semiannual 2016 event. Well gauging and sampling records for the semiannual event are provided in Appendix A.

2.2 Field and Laboratory Methods

Field activities were conducted in accordance with the revised sampling plans as described in Section 1. Groundwater samples collected for DLA Energy were submitted to American Analytics in Chatsworth, California. Groundwater samples collected for SFPP were submitted to Alpha Analytical, Inc. (Alpha) in Sparks, Nevada. Both analytical laboratories are certified by the Environmental Laboratory Accreditation Program of the California Department of Public Health. Samples were submitted to these laboratories for the analyses described in Section 2.2.2.

2.2.1 Field Methods

Prior to starting gauging, purging, or sampling activities, SFPP and DLA Energy remediation systems were shut down for approximately 1 week. Subsequently, SGI or Blaine Tech measured depth to water in each well using an electronic water level sounder, or depth to water and free product thickness using an interface probe. The down-well field instruments used to gauge the wells were cleaned with a laboratory-grade, nondetergent cleaner, and then rinsed successively in two containers with distilled water before each use.

Before sampling, each well was purged by using low-flow purge techniques at a rate of approximately 200 to 500 milliliters per minute. During purging, groundwater field parameters consisting of temperature, pH, electrical conductivity, turbidity, dissolved oxygen, and oxidation-reduction potential were monitored. Water levels also were monitored during low-flow purging to verify minimal drawdown. Samples for SFPP were collected using a 2-inch-diameter submersible Grundfos pump with new or dedicated tubing, whereas samples for DLA Energy were collected using a 2-inch-diameter Mega-

Monsoon submersible pump with new or dedicated low-density polyethylene tubing used for each well. Well gauging and sampling records are provided in Appendix A.

Groundwater field parameters were allowed to stabilize before collecting the sample. Water samples to be analyzed for TPH-g, TPH-d, and volatile organic compounds (VOCs) were collected in 40-milliliter volatile organic analysis vials containing hydrochloric acid preservative, filled to zero headspace, and sealed with Teflon septa and airtight caps. DLA Energy water samples for TPH-d analysis were collected in 1/2-liter amber bottles and sealed with Teflon-lined airtight caps. The samples were labeled and placed on ice for transport to the laboratory following proper chain-of-custody procedures.

2.2.2 Laboratory Analytical Methods

Samples collected for DLA Energy were sent to American Analytics for laboratory analysis; samples collected for SFPP were sent to Alpha for laboratory analysis. The laboratory analytical program for the sampling events included analysis for VOCs using U.S. Environmental Protection Agency (EPA) Method 8260B, and TPH using purge-and-trap and/or extraction sample preparation techniques followed by EPA Method 8015 (modified). Results for TPH analyses using the purge-and-trap preparation technique were quantified and reported against a commercial gasoline standard (C4 to C13) and are abbreviated as “TPH-g” throughout this report. Results for TPH analyses using extraction sample preparation for groundwater samples were quantified and reported against a commercial diesel standard (C14 to C22) and are abbreviated as “TPH-d” throughout this report. Copies of the laboratory analytical reports are presented in Appendix B.

Groundwater Gauging Results

Measurements of water levels and free product thickness collected during the semiannual monitoring event are described in this section. Groundwater extraction (GWE) systems for both DLA Energy and SFPP were shut down approximately 1 week prior to the first semiannual 2016 groundwater gauging and sampling activities. Free product thicknesses, depths to groundwater, and calculated groundwater elevations are presented in Table 2. Groundwater elevations in wells with measureable free product were corrected for water-product density differences using a specific gravity ranging between 0.75 and 0.83 for the free product, multiplying this specific gravity by the measured product thickness, and adding this correction to the groundwater elevation. A specific gravity of 0.80 was used for DLA Energy wells; the specific gravity for SFPP's wells varied and was based on field measurements collected during baildown testing conducted in 2014. Groundwater elevation contours for the uppermost groundwater zone, along with estimated free product plumes, are shown on Figure 2. Historical water level measurements, free product thicknesses, and groundwater elevations are presented in Appendix C. Wells meeting at least one of the following criteria were not considered in contouring groundwater elevation in the uppermost groundwater zone:

- Wells screened in the Exposition aquifer (denoted as "EXP" wells)
- Wells screened near the bottom of the uppermost aquifer (denoted as "MID" wells)
- Wells with groundwater elevations that were inconsistent with surrounding groundwater elevations

3.1 Groundwater Flow Conditions

Overall groundwater flow and gradient conditions encountered during the first semiannual 2016 monitoring event were similar to those encountered during previous monitoring events at the site. Historically, the overall flow direction (assuming no wells are pumping) in the uppermost aquifer has been to the north-northwest. The overall flow direction during this monitoring event was to the north, with a horizontal hydraulic gradient of approximately 0.0010 foot per foot (ft/ft) (Figure 2) in the southern part of the site, and essentially no gradient in the tank farm area.

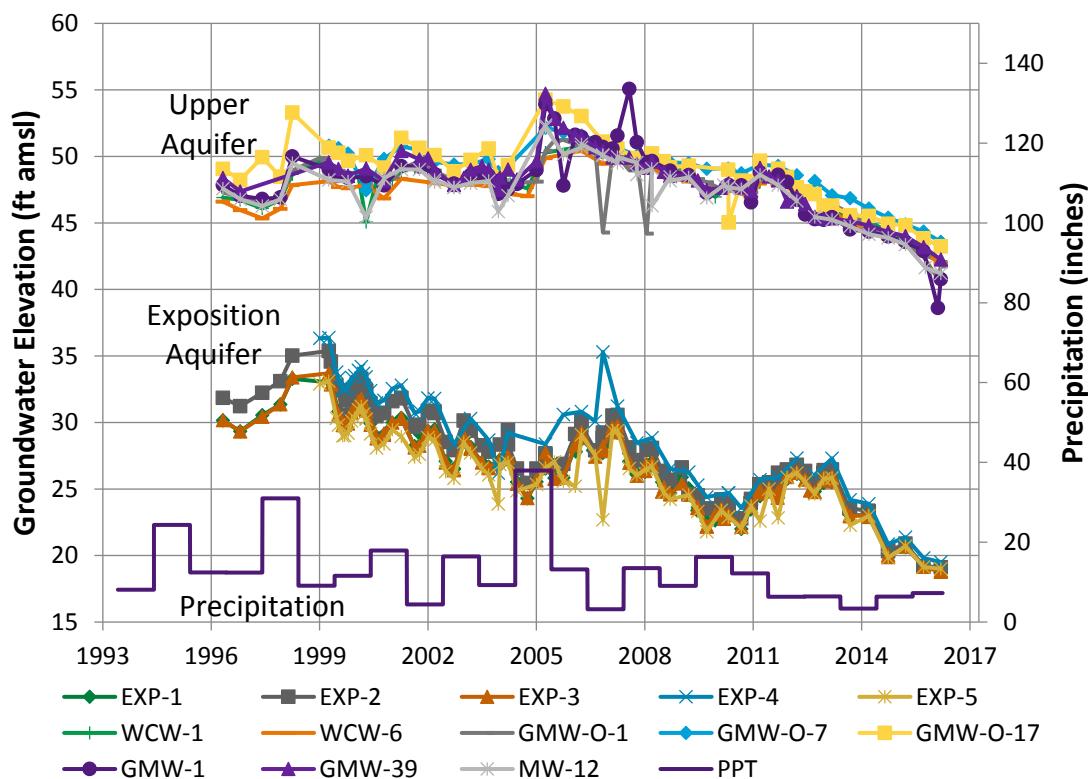

An isolated groundwater mound was interpreted near wells GMW-21, MW-10, and PZ-3 in the northwestern area. To the east of these wells, a small depression was interpreted near GMW-15. In the eastern area, another groundwater mound was interpreted near wells GMW-58 and GMW-59. A large groundwater depression was interpreted in the south-central area that is associated with recovering groundwater levels after active groundwater extraction and biosparging in that area. Groundwater elevations used in contouring ranged from 40.58 feet above mean sea level (amsl) in GMW-28 to 43.58 feet amsl in GMW-O-7. Groundwater elevations considered anomalous are not included in the range listed here, but are indicated with a red asterisk on Figure 2. In general, groundwater elevations were approximately 1.5 feet lower than reported in April 2015 (CH2M, 2015a).

Groundwater levels in MW-18 (MID), MW-19 (MID), MW-20 (MID), MW-21 (MID), and MW-22 (MID) screened in the lower section of the uppermost aquifer varied from groundwater levels measured in nearby wells installed in the upper portion of the uppermost aquifer. Groundwater elevations in these five "MID" wells ranged from 36.78 feet amsl in MW-18 (MID) to 45.17 feet amsl in MW-19 (MID).

Groundwater levels were measured in the five Exposition aquifer wells (EXP-1 through EXP-5) at and near the site. Groundwater elevations used in contouring the Exposition aquifer ranged from 18.78 feet amsl in EXP-3 to 19.51 feet amsl in EXP-4. Figure 3 shows groundwater elevation contours for the Exposition aquifer. Groundwater elevations in the Exposition aquifer were approximately 1.75 feet lower than those in April 2015 (CH2M, 2015a). The groundwater gradient in the Exposition aquifer

beneath the site in April 2016 was 0.0002 ft/ft toward the east-southeast, indicating a flow direction generally similar to those previously interpreted for the site. The groundwater flow direction in the Exposition aquifer remains substantially different from the uppermost groundwater zone.

Groundwater elevations across the site, in the uppermost aquifer, are higher than elevations in the Exposition aquifer, by approximately 20 to 25 feet (as observed in the hydrograph below). This vertical gradient across the aquitard is consistent with historical conditions and demonstrates that the aquitard impedes groundwater flow from the uppermost aquifer to the Exposition aquifer. Additionally, the difference in groundwater flow direction between the uppermost aquifer and Exposition aquifer (northward and east-southeastward, respectively), also demonstrates that there is minimal communication between the two water bearing zones.

3.2 Distribution of Free Product

During this semiannual monitoring event, measurable free product was observed in 14 of the 139 wells that were gauged:

- North-central area: wells TF-16, TF-18, and TF-23
- Eastern area: wells GW-15 (6") and GMW-62
- South-central area: wells GMW-10, GMW-22, GMW-23, GMW-29, GMW-O-11, GMW-O-12, GMW-O-21, and MW-O-2
- Southeastern area: well GMW-36

Free product was detected at thicknesses ranging from 0.01 foot in well GMW-62 to 6.49 feet in well GMW-O-12. Free product thicknesses, well gauging data, and groundwater elevations are summarized in Table 2. The detection of free product in these wells during this sampling event were used in

interpreting the current extent of free product at the site. These interpretations are shown on Figure 2 and indicate free product in the northern tank farm area (the north-central area), the eastern area, the south-central area, and the southeastern 24-inch block valve area. It is believed that increased product thicknesses over the last several semiannual monitoring events are indicative of continued declining water levels across the site.

The current low water levels have allowed residual product to drain from pore spaces within the smear zone and collect in certain wells, or increase in thickness in wells with measureable product already present. The water table elevation is related to annual rainfall and the cumulative rainfall over time. As shown in the hydrograph in Section 3.1, since the 2005/2006 El Niño “effect”, groundwater elevations in the uppermost aquifer declined approximately 6 feet to the current low water levels across the site.

Free product was present in the north-central area in wells TF-16, TF-18, and TF-23. The product thickness for these wells ranged from 0.27 foot in well TF-23 to 2.96 feet in well TF-18. The extent of the north-central free product plumes are interpreted as isolated or separate plumes.

In the eastern area, a limited extent of free product was interpreted based on a measurable thickness of free product in wells GMW-62 and GW-15(6") (0.01 and 0.07 foot thick, respectively). Free product has been detected in these wells during past events.

Free product was detected in the south-central area in wells GMW-10, GMW-22, GMW-23, GMW-29, GMW-O-11, GMW-O-12, GMW-O-21, and MW-O-2. Free product has been detected in these south-central wells during past events. The product thickness ranged from 0.02 foot in well GMW-23 to 6.49 feet in well GMW-O-12. The magnitude and extent of free product in the south-central area has declined substantially since April 2015. The extent of the south-central area free product plume has been interpreted as one continuous plume in recent years; however, the plume is now interpreted as separate smaller plumes. It is believed that the decrease in product thickness and areal extent is a result of biosparging that has been implemented in the south-central area since January 2016.

Free product was detected in the southeastern 24-inch block valve area in wells GMW-36 (0.27 foot thick) during this monitoring event, which is consistent with historical data. Free product was not reported in wells GMW-O-15 and GMW-O-18, where it has been detected in the past.

Continued total fluids extraction (TFE), manual bailing, and the use of fuel-absorbent socks will continue to remove the product that has accumulated in wells across the site.

Groundwater Quality

Groundwater quality results for the semiannual monitoring event are presented in Section 4.1. Related quality assurance/quality control, water disposal, and health and safety are discussed in Sections 4.2 through 4.4.

4.1 Results for the First Semiannual 2016 Groundwater Monitoring Event

The April 2016 analytical results for TPH, benzene, 1,2-DCA, MTBE, and TBA were used to develop isoconcentration contours and interpret the extent of these analytes in groundwater beneath the site. Isoconcentration contours for TPH, benzene, 1,2-DCA, MTBE, and TBA are shown on Figures 4 through 8, respectively. Analytical results from the current semiannual monitoring event (April 2016) and two previous semiannual monitoring events (April and October 2015) are also shown on these figures. The data labels are color-coded to indicate whether concentrations from the April 2016 semiannual event are increasing, decreasing, or stable compared with concentrations from the April 2015 semiannual event. A blue data label indicates a decrease in concentration greater than or equal to 10 percent from the previous year, a red label indicates an increase greater than or equal to 10 percent, and a white label indicates no change greater than 10 percent or the change could not be determined because of insufficient data. The changes in concentrations may be a result of seasonal fluctuations of the water table elevation or remediation system operations.

Laboratory analytical results for TPH, BTEX, 1,2-DCA, MTBE, TBA, di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), and tertiary amyl methyl ether (TAME) are summarized in Table 3; other VOCs detected by EPA Method 8260B analyses are summarized in Table 4. Historical analytical results are presented in Appendix D. Time series charts for select monitoring and remediation wells are presented in Appendix E. Copies of the laboratory reports for the April 2016 semiannual monitoring event are presented in Appendix B. The following subsections summarize the results for selected analytes or analyte groups.

4.1.1 Total Petroleum Hydrocarbons

As shown on Figure 4, the analytical results for TPH-g and TPH-d reported for each well during the first semiannual 2016 monitoring event are summed and contoured as TPH. The separate concentrations of TPH-g and TPH-d are listed in Table 3. The maximum reported concentration of TPH-g was 11,000,000 micrograms per liter ($\mu\text{g}/\text{L}$) in well GMW-O-18 in the southeastern 24-inch-block valve area; likewise, the maximum concentration of TPH-d, at the site, was reported in well GMW-O-18 at 5,900,000 $\mu\text{g}/\text{L}$. The maximum reported concentrations for TPH in well GMW-O-18 are anomalously high, and these concentrations may be an artifact of residual free product in the groundwater sample as a result of free product that was observed in the well in 2014. The time-series chart included in Appendix E for well GMW-O-18 exhibits the increase in dissolved-phase constituents following the temporary occurrence of free product in 2014. TPH was not detected in any of the Exposition aquifer wells during this semiannual monitoring event.

Several monitoring wells in the north-central area were not sampled by DLA Energy because the wells were not accessible during the ongoing soil excavation activities; therefore, previous groundwater data from April and October 2015 were used to assist with the interpretation of the lateral extent of TPH in April 2016. As shown on Figure 4, the lateral extent of TPH was relatively similar to recent monitoring events. The detected TPH concentration in wells GMW-21 (1,500 $\mu\text{g}/\text{L}$), GMW-47 (450 $\mu\text{g}/\text{L}$), and MW-

29 (350/360 µg/L) decreased since April 2015, as indicated by the blue data boxes on Figure 4. TPH in GMW-15 (3700 µg/L) increased since April 2015 as indicated by the red data box. The maximum reported TPH concentration in this area was at well GMW-15 (3,700 µg/L), located in the northwestern portion of the north-central plume.

In the eastern part of the site, for April 2016, the interpreted extent of where TPH was detected extends offsite to the east of new monitoring wells GMW-67, GMW-68, and GMW-69. The maximum TPH concentration in this area was reported in GMW-68 (16,000 µg/L), located just east of well GMW-62, where there was measurable free product. TPH has not been detected in wells GMW-63 and GMW-64 in the eastern offsite area since monitoring of these wells began in October 2008. Similarly, TPH was not detected in offsite well GMW-65 in April 2016. The TPH concentrations reported in wells GMW-47 (450 µg/L), GMW-58 (290 µg/L), GMW-60 (210 µg/L), and GMW-61 (330 µg/L) decreased since April 2015. The TPH concentration in wells GMW-57 (400 µg/L) and GMW-59 (3900 µg/L) increased since April 2015. The TPH concentration at wells GW-16 and MW-17 was nondetect or less than the laboratory reporting limit.

The lateral extent of TPH in the northwestern portion of the site is similar to the extent interpreted for April 2015. The maximum TPH concentration was reported in well MW-26 duplicate (430 µg/L). TPH decreased in wells MW-22 (MID) (170 µg/L), MW-24 (< 100 µg/L), and MW-26 duplicate (430 µg/L) since April 2015. TPH was not detected in any western offsite wells during April 2016.

The lateral extent of TPH in the south-central and southern offsite areas is similar to the extent interpreted for April 2015, although concentrations increased in offsite wells GWM-O-9 and GMW-O-10 and onsite wells HL-2, HL-3, GMW-26, MW-18 (MID), MW-SF-14, MW-21 (MID), and PZ-2. To the north of the south-central area near former Tank 80009, TPH also increased in well GMW-8 (230 µg/L). TPH decreased in GMW-28 (690 µg/L) since April 2015. The highest TPH concentration was reported in onsite well MW-SF-14 (17,000 µg/L). The increase in TPH observed in these wells is likely an effect of pilot testing and operation of the south-central area biosparge well. This effect is likely temporary and concentrations are anticipated to decline over time with continued operation of the biosparge system. As shown on Figure 4, samples were not collected in several remediation wells in the south-central area because of the presence of free product, but the interpreted extent of TPH is similar to previous monitoring events. TPH was not detected in any of the southern offsite wells south (upgradient) of Cheshire Street.

Near the truck rack area, TPH was detected in well GMW-1 and MW-9 at concentrations similar, or lower than, those reported in April 2015. The maximum TPH concentration reported in this area was in MW-9 (1,400 µg/L). TPH data were not available for wells GMW-3, GMW-4, GMW-14, and MW-15 during this semiannual event because these wells were previously decommissioned or not accessible because of soil excavation activities.

In the southeastern part of the site, the interpreted extent of TPH decreased slightly because TPH in well GMW-O-24 was not detected. The maximum TPH concentration in this area was reported in offsite remediation well GMW-O-18 (17,000,000 µg/L). Well GMW-O-18 is located downgradient of remediation wells GMW-36 and GMW-O-15 (near the source area), where there has been a historical presence of free product. TPH decreased in offsite wells PZ-5 (1,600 µg/L) and GMW-O-24 (< 50 µg/L). TPH increased in GMW-O-16 (310 µg/L) since April 2015. TPH was not detected in southeastern wells GMW-39, GMW-O-17, GMW-O-19, GMW-SF-7, GMW-SF-8, and MW-8 during April 2016.

4.1.2 Benzene

Figure 5 shows the contours of dissolved benzene concentrations reported during the semiannual monitoring event. Analytical results for benzene in groundwater samples collected during this semiannual event indicate that concentrations ranged from nondetect in many wells) to 53,000 µg/L in

southeastern remediation well GMW-O-18. As discussed in Section 4.1.1, increases in dissolved-phase concentrations in well GMW-O-18 may be a result of residual free product in the groundwater sample. Benzene was not detected in wells west of the site or in any of the Exposition aquifer wells.

A dissolved benzene plume was interpreted to extend across the northwestern portion of the site because benzene was detected at low-levels (trace) in wells GW-2 (1 µg/L), GW-3 (1 µg/L), GW-13 (0.57 µg/L), MW-26 (0.8 µg/L), and MW-27 (1.2 µg/L). Benzene was nondetect in these wells in April 2015; therefore, the current detections represent an overall increase in concentration as indicated by the red data boxes shown on Figure 5.

The lateral extent of benzene in the north-central portion of the site was similar to the extent interpreted for April 2015. To the north of the main plume, an isolated plume was interpreted near MW-13 because benzene was detected at low-levels (0.95 µg/L); this represents an overall increase since April 2015. Increases in benzene concentrations were also reported in wells GMW-15 (0.56 µg/L), MW-16 (1.3 µg/L), and GMW-58 (1.3 µg/L). A decrease in benzene was reported in wells GMW-6 duplicate (0.92 µg/L) and GMW-21 (< 0.5 µg/L), when compared with concentrations reported in April 2015.

In the eastern part of the site, benzene concentrations decreased in wells GMW-59 (87 µg/L), and GW-61 (0.65 µg/L), and increased in wells GMW-58 (1.3 µg/L) and GMW-60 (5.1 µg/L), when compared with concentrations reported in April 2015. The maximum concentration of benzene in the north-central/eastern part of the site during April 2016 was reported in offsite well GMW-68 (2,300 µg/L). Benzene was also detected in offsite wells GMW-67 (22 µg/L) and GMW-69 duplicate (260 µg/L), but were not detected in wells GMW-63, GMW-64, and GMW-65, further to the east.

Overall, the extent of the benzene plume in the south-central area remained similar to the extent interpreted for April 2015. Benzene concentrations increased in MW-18 (MID) (65 µg/L) and PZ-2 duplicate (120 µg/L) and offsite well GMW-O-10 (430 µg/L), when compared with the April 2015 concentrations, when both wells were nondetect. The highest concentration of benzene was reported in onsite well GMW-30 (3,600 µg/L), where there has been free product in recent semiannual monitoring events. Benzene concentrations decreased in wells GMW-28 (370 µg/L), MW-SF-14 (4.7 µg/L), and offsite well GMW-O-14 duplicate (1,400 µg/L). Benzene continues to be nondetect in well GMW-1, located just west of the truck rack area. Benzene was not detected in offsite monitoring wells south of Cheshire Street.

Near the truck rack area, benzene concentrations decreased in well MW-9 (1.7 µg/L), and remained nondetect in GMW-13. Due to the lone detection of benzene in well MW-9, an isolated plume was interpreted south of the truck rack area. Benzene data were not available for wells GMW-3, GMW-4, GMW-14, and MW-15 during this semiannual event because these wells were previously decommissioned or were not accessible as result of ongoing soil excavation activities.

The lateral extent of the benzene plume in the southeastern area was less than the extent interpreted for April 2015. Benzene was nondetect in offsite wells GMW-O-16, GMW-O-24, and well PZ-5 in April 2016; which represents an overall decrease in the concentration, relative to April 2015. At well PZ-5 the concentration decreased from 1,100 µg/L in April 2015 to less than the laboratory reporting limit in April 2016. Additionally, benzene was not detected in southeastern wells GMW-39, GMW-O-17, GMW-O-19, and MW-8 during April 2016. The maximum benzene concentration in the southeastern area was reported in remediation well GMW-O-18 (53,000 µg/L). Benzene was also reported in remediation wells GMW-36 (660 µg/L) and GMW-O-15 (5,700 µg/L).

4.1.3 1,2-Dichloroethane

Dissolved 1,2-DCA concentrations reported during this semiannual monitoring event are contoured on Figure 6. Analytical results for 1,2-DCA indicate concentrations ranged from nondetect, in many

wells, to 10 µg/L in well MW-20 (MID), in the western onsite area. 1,2-DCA also was not detected in any of the wells sampled in the eastern, southeastern, and southern offsite areas of the site. 1,2-DCA was not detected in any of the Exposition aquifer wells during April 2016.

The lateral extent of 1,2-DCA in the western region remained relatively consistent with the extent interpreted for April 2015. An isolated 1,2-DCA plume was interpreted in the north-central area near well MW-16 (0.51 µg/L). In the western plume region, 1,2-DCA concentrations decreased in wells GW-2 (1.2 µg/L), GW-13 (6.6 µg/L), and MW-22(MID) (6.8 µg/L), relative to concentrations reported in April 2015. An increase in 1,2-DCA concentration was reported in wells GMW-8, MW-6, MW-7, MW-19 (MID), MW-20 (MID), and WCW-7, where concentrations ranged from 0.72 µg/L to 10 µg/L in April 2016.

As listed in Appendix D and shown on Figure 6, concentrations of 1,2-DCA in groundwater in the vicinity of the West Side Barrier and in the western offsite area have remained consistently low. Pumping of the West Side Barrier wells was discontinued in August 2008; groundwater quality conditions in the area have been stable since then and will continue to be monitored.

4.1.4 Methyl Tertiary Butyl Ether

Figure 7 shows contours of dissolved MTBE concentrations reported during the semiannual monitoring event. Analytical results for MTBE indicate concentrations ranged from nondetect, in many wells, to 6,000 µg/L in southeastern remediation well GMW-O-18. As discussed in Section 4.1.1, increases in dissolved-phase concentrations in well GMW-O-18 may be a result of residual free product in the groundwater sample. MTBE was detected in 27 wells that were sampled during the semiannual event. At Exposition aquifer well EXP-1, MTBE was detected in both of the split samples collected on behalf of SFPP and DLA Energy (1.0 µg/L and 1.7 µg/L, respectively). Low-level detections of MTBE have been reported in EXP-1 during past events. MTBE was not detected in any other Exposition aquifer wells during the April 2016 monitoring event.

In general, the distribution of dissolved MTBE in April 2016 was similar to the extent interpreted for April 2015. However, the south-central plume is currently interpreted as one continuous plume that extends in a northwestern direction to offsite well WCW-7. During the April 2016 semiannual monitoring event, MTBE was detected in the northwestern portion of the site, the north-central area, the south-central area, the truck rack area, the southeastern area, and the southern offsite area. MTBE was not detected in the eastern offsite area.

The lateral extent of MTBE in the western area of the site was similar to the extent interpreted for April 2015. MTBE increased in offsite well WCW-7 (0.82 µg/L) and onsite well MW-6 (1.2 µg/L), relative to the concentrations reported in April 2015. MTBE was not detected in any other western offsite wells. A decrease in MTBE was reported in wells GMW-8 (1.4 µg/L), MW-19 (MID) (1 µg/L), MW-20 (MID) (8.9 µg/L), and MW-22 (MID) (5 µg/L). The MTBE contour lines were not inclusive of wells GW-4 and GW-6, where MTBE was present in April 2015, because the wells were not accessible for sampling this event.

The lateral extent of MTBE in the north-central and eastern areas of the site is consistent with the extent interpreted for April 2015. Two isolated plumes were interpreted based on low-level detections of MTBE in well GMW-21 (2.8 µg/L) near former Tank 80002; and in wells GMW-47 (5.7 µg/L), GMW-50 (1.3 µg/L), and GMW-59 (1 µg/L) near former Tanks 80004, 80008, and 80017. An isolated plume was not interpreted near well GMW-19, where MTBE was present in April 2015, because the well was not accessible for sampling. MTBE was not detected in any eastern offsite wells in April 2016.

In general, the lateral extent of MTBE in the south-central area is similar to the interpretation for April 2015. However, the plume was extended to the north as one continuous plume because MTBE was detected in wells GMW-26 (0.72 µg/L) and PZ-2 (1.3 µg/L). The extent of MTBE in this area was interpreted as three separate plumes in April 2015. The extent of the western edge of the south-central plume has retracted slightly since well HL-2 was nondetect for MTBE. In the main plume area, MTBE

increased in wells GMW-1 (2.9 µg/L), GMW-26 (0.72 µg/L), MW-18 (MID) (4.7 µg/L), MW-21 (MID) (0.79 µg/L), MW-SF-14 (63 µg/L), and PZ-2 (1.3 µg/L). MTBE was detected in one offsite well (GMW-O-14) at a concentration of 13 µg/L. This detection represents an overall decrease in concentration since April 2015. Decreases in MTBE were also reported in wells GMW-28 (25 µg/L), HL-2 (< 0.5 µg/L), and HL-3 (< 0.5 µg/L). MTBE was not detected in any monitoring wells located south of Cheshire Street.

One isolated plume of MTBE was interpreted near the truck rack area, because MTBE was detected at a low-level in MW-9 (1.8 µg/L). This detection represents a decrease when compared with detections reported in April 2015. MTBE remained nondetect in well GMW-13. MTBE data were not available for wells GMW-3, GMW-4, GMW-14, and MW-15 because these wells were previously decommissioned or were not accessible because of soil excavation activities.

The lateral extent of MTBE in the southeastern 24-inch-block-valve area decreased slightly under the extent interpreted for April 2015 (this is based on decreases in MTBE nondetect concentrations in onsite well MW-8 and offsite well GMW-O-24). A decrease in MTBE was also reported in well PZ-5, where the concentration decreased from 150 µg/L in April 2015 to 7.6 µg/L in April 2016. The highest concentration of MTBE was reported in offsite remediation well GMW-O-18 (6,000 µg/L). MTBE was also detected in remediation wells GMW-36 (540 µg/L) and GMW-O-15 (2,800 µg/L). MTBE concentrations remained nondetect in offsite southeastern wells GMW-O-16, GMW-O-17, GMW-O-19, and GMW-O-24 during the April 2016 sampling event.

4.1.5 Tertiary Butyl Alcohol

Figure 8 shows contours of dissolved TBA concentrations, as reported during the semiannual monitoring event. The lateral extent of TBA across the site was interpreted to be less than the extent interpreted for April 2015. This is primarily because the absence of TBA data for many wells in the eastern and north-central areas were not available. A decrease in TBA concentration to nondetect was reported in wells GMW-47, GMW-60, and GMW-61, located in the eastern area. Similar to April 2015, TBA was also absent in the eastern and western offsite areas. TBA was not detected in any Exposition aquifer wells during the April 2016 monitoring event.

Analytical results for TBA indicate concentrations ranged from nondetect, in many wells, to 72,000 µg/L in well PZ-5 in the southeastern offsite area. Historically, this well has had the highest concentrations of TBA in this area, as well as the entire site. Also in the southeastern area, TBA was detected in offsite remediation wells GMW-36 (1400 µg/L) and GMW-O-15 (3400 µg/L). TBA was not detected in offsite wells GMW-O-16, GMW-O-17, GMW-O-19, and GMW-O-24, or onsite wells MW-8, GMW-39, GMW-SF-7, and GMW-SF-8 during the April 2016 monitoring event. The lateral extent of TBA in the southeastern area was less than the interpreted extent in April 2015 because of the nondetects reported in wells GMW-O-16, GMW-O-24, and GMW-SF-7. The detection limit for TBA in remediation well GMW-O-18 was too high to determine the presence or absence of TBA at this location.

The lateral extent of TBA in the south-central portion of the site was similar to the extent interpreted for April 2015. The northern edge of the plume extends to the northwest at well MW-20 (MID) where the TBA concentration increased to 25 µg/L in April 2016. Increases in TBA were also reported in wells GMW-1 (22 µg/L), MW-SF-14 (500 µg/L), MW-18(MID) (74 µg/L), and MW- 19(MID) (420 µg/L), whereas the concentrations decreased in wells PZ-2 and GMW-O-14 to nondetect. TBA was not detected in any offsite wells to the south.

In the truck rack area, one small isolated plume of TBA was interpreted based on a detection in MW-9 (30 µg/L). This represents an overall decrease in this well from a year ago. TBA remained nondetect in well GMW-13. TBA data were not available for wells GMW-3, GMW-4, GMW-14, and MW-15 during this semiannual event because these wells were previously decommissioned or were not accessible because of soil excavation activities.

4.1.6 Other Fuel Oxygenates

Pursuant to the RWQCB's request in March 2009, analysis for other fuel oxygenates including ETBE, DIPE, TBA, and TAME using EPA Method 8260B was included in the April 2016 sampling event (RWQCB, 2009a, 2009b). ETBE and TAME were not detected in any of the samples collected during the April 2016 sampling event. DIPE was detected in eight wells located in the south-central area, West Side Barrier region, and northwestern portion of the site. DIPE was detected in three of the five "MID" wells that were sampled. The maximum DIPE concentration was reported in well GMW-O-14 (100 µg/L), located in the southern offsite area.

4.2 Quality Assurance/Quality Control

Alpha and American Analytics did not report any significant quality assurance/quality control issues with the analytical work performed during the April 2016 semiannual event. A total of 14 duplicate groundwater samples, 9 trip blanks, and 13 equipment blanks were submitted to the laboratories. All trip blank and equipment blank samples were reported as nondetect for all analytes of concern. Analytical results for duplicate groundwater samples and trip and equipment blanks are summarized in Tables 5 and 6, respectively.

4.3 Water Disposal

Purged groundwater from this monitoring event was treated at the onsite remediation systems. Purged groundwater extracted by Blaine Tech, on behalf of SFPP, was treated in the SFPP system located in the south-central area and discharged under National Pollutant Discharge Elimination System (NPDES) Permit No. CA0063509. Purged groundwater extracted by SGI on behalf of DLA Energy was treated in the DLA Energy system located in the northern part of the site and discharged under NPDES Permit No. CAG834001.

4.4 Health and Safety

Field activities were conducted in accordance with site-specific health and safety procedures, including protocol for safe work practices during the field portion of the project. Personnel working at the site were required to adhere to the health and safety program.

Remediation System Operations and Effectiveness

5.1 System Operations

SFPP and DLA Energy currently submit quarterly remediation progress reports to the RWQCB and the Restoration Advisory Board (RAB) to provide details of the remediation system operations. DLA Energy created a website (www.norwalkrab.com) to house project information including agendas, minutes, and presentations from RAB meetings dating back to 1994. In addition, historical project information and reports can be located in the information repository at the Norwalk Regional Library.

5.1.1 DLA Energy

The remediation system operated at the site by DLA Energy consists of soil vapor extraction (SVE), GWE, and absorbent sock installations for passive recovery of free product. DLA Energy is conducting GWE from two pumping wells (GW-2 and GW-13) in the northwestern corner of the site, and from two wells (GW-15 and GW-16) in the northeastern area bordering Holifield Park. Free product recovery efforts have recently been enhanced through the installation of additional product-recovery wells near TF-18. These wells will be connected to the remediation system in the summer of 2016. The GWE system is designed to contain and reduce the extent of the free product and dissolved plumes. SVE also is underway from the horizontal wells that span the entire former aboveground tank farm area and from the northeastern boundary area. Localized vacuum recovery of free product is also conducted as needed, and passive absorption is conducted at specific wells.

In addition, DLA Energy is currently conducting soil remediation in accordance with the RWQCB-approved *Soil Remedial Action Plan* (SGI, 2014), *Revised Field Sampling and Analysis Plan and Sampling Strategy* (SGI, 2015a), *Workplan for VOC Analysis Results Validation* (SGI, 2015b), and *Proposed Addendum to the Soil Cleanup Goals* (SGI, 2015c). Soils in areas identified for remediation are excavated and treated onsite. After the RWQCB reviews confirmation sample results, the RWQCB approved the treated soil as backfill for the remedial excavations.

5.1.2 SFPP

The remediation systems operated by SFPP consist of SVE, TFE, GWE, and treatment of extracted soil vapor and groundwater to address two specific areas at and near the site: the south-central area and the southeastern area. SFPP also previously operated a GWE system for remediation of the western offsite area (or West Side Barrier area). The TFE and GWE systems are designed to contain and reduce the extent of free product, provide hydraulic capture of dissolved constituents of concern, and lower the free product surface (where present) and groundwater table, thus exposing more hydrocarbon-impacted soil for SVE. Additionally, SFPP conducts manual bailing of free product in select wells, as needed.

SFPP recently completed installation of a horizontal biosparge system in the south-central area of the site. Construction of the biosparge well is documented in the report titled, *Horizontal Biosparge Well and Soil Vapor Monitoring Probe Completion Report* (CH2M, 2015b). The biosparge system injects ambient air into the horizontal biosparge well BS-01, through a rotary screw air compressor, at a maximum design rate of 500 standard cubic feet per minute. SFPP's SVE system has an interlock that ensures the biosparge system cannot operate unless the SVE system is operating. Operation of the SVE system reduces the potential for off-gassing of VOCs during biosparge operations. Pilot testing

commenced on January 6, 2016, and is anticipated to continue for approximately 1 year to evaluate the feasibility of system expansion.

At the end of the second quarter 2016, SFPP's TFE and GWE systems were offline to facilitate construction of a new oil/water separator and to relocate equipment to a new remediation pad. It is anticipated that the systems will be back online in early August 2016. SFPP's SVE and biosparge systems are currently operational.

5.2 System Effectiveness

Based on the results presented in this report, it is believed that DLA Energy's remediation systems in the north-central area and SFPP's remediation systems in the south-central and southeastern areas are effectively containing dissolved-phase constituents across the site. The lateral extent of dissolved-phase plumes has been reduced from the historical maximum and currently appears to be stable and consistent with previous monitoring events.

- Dissolved-phase constituents in the western offsite area have been nondetect or are at concentrations near the laboratory reporting limit, indicating the plumes have generally been contained onsite.
- Dissolved TPH, and benzene in the eastern area are interpreted to extend offsite to just beyond new monitoring wells GMW-67 and GMW-69. Dissolved-phase constituents are not detected in wells GMW-63, GMW-64, and GMW-65, located to the east.
- The offsite extent of dissolved-phase constituents in the south-central area is limited to areas north of Cheshire Street, which is consistent with previous monitoring events. SFPP will continue to extract groundwater in the south-central area and monitor for MTBE and other constituents.
- In the southeastern area, the lateral extent of the dissolved-phase plume has been relatively stable since hydrocarbon constituents were pulled downgradient from wells GMW-36 and GMW-O-15 after extraction activities were initiated at wells GMW-O-18 in April 2010, in response to RWQCB's request. Downgradient well GMW-O-24 has not had detectable hydrocarbon constituents since the second semiannual 2015 event, demonstrating that the plume is stable. SFPP will continue to extract groundwater in the southeastern area and monitor for MTBE and other constituents.

SFPP continues to monitor the amount of free product that has accumulated in the product holding tank of the groundwater treatment system. During the second quarter 2016, 22 gallons of product accumulated in the tank; whereas, a year ago, 813 gallons of accumulated product in the tank was reported. The magnitude and extent of free product in the south-central area has declined substantially since April 2015. It is believed that the decrease in product thickness and areal extent is a result of biosparge operations that has been implemented in the south-central area since January 2016. TFE and manual product removal from extraction wells will continue to be performed during the third and fourth quarters of 2016 to maximize product removal across the site.

The low detections of MTBE and 1,2-DCA and the delineated plume extents in the western area do not warrant restarting the West Side Barrier treatment system. VOCs and TPH will continue to be monitored in this area.

Throughout 2016, DLA Energy will continue to conduct soil excavation activities across the site at shallow soil areas that exceed the approved soil cleanup goals. In the third and fourth quarters 2016, DLA Energy will focus on completion of soil treatment and backfilling, and will resume deeper soil remediation.

Summary

The first semiannual 2016 groundwater monitoring event was conducted in April 2016 at the site and its vicinity. In general, groundwater quality conditions interpreted from this monitoring event are similar to those interpreted a year ago for the April 2015 semiannual monitoring event. Free product accumulation in several remediation and monitoring wells decreased since recent semiannual events due, in part, to biosparging system operations in the south-central area of the site. The lateral extent of dissolved-phase plumes has been reduced from the historical maximum and currently appears to be stable and consistent with previous monitoring events.

6.1 Groundwater Flow Conditions

Groundwater elevations in the uppermost groundwater zone and the Exposition aquifer decreased by approximately 1.5 feet and 1.75 feet, respectively, since the April 2015 semiannual monitoring event. The overall flow direction during this monitoring event in the uppermost groundwater zone was to the north, with an estimated horizontal hydraulic gradient of approximately 0.0010 ft/ft in the southern area to nearly flat in the truck fueling and tank farm areas. This is generally consistent with previous monitoring events. The horizontal hydraulic gradient in the Exposition aquifer was 0.0002 ft/ft to the east-southeast, similar to the general historical flow direction.

6.2 Distribution of Free Product

During this semiannual monitoring event, measurable free product was observed in 14 of the 139 wells that were gauged:

- North-central area: wells TF-16, TF-18, and TF-23
- Eastern area: wells GW-15 (6") and GMW-62
- South-central area: wells GMW-10, GMW-22, GMW-23, GMW-29, GMW-O-11, GMW-O-12, GMW-O-21, and MW-O-2
- Southeastern area: well GMW-36

Free product was detected at thicknesses ranging from 0.01 foot to 6.49 feet. The magnitude and extent of free product in the south-central area has declined substantially since April 2015. The extent of the south-central area free product plume has been interpreted as one continuous plume in recent years; however, the plume is now interpreted as separate smaller plumes. It is believed that the decrease in product thickness and areal extent is a result of biosparging that has been implemented in the south-central area since January 2016.

6.3 Dissolved-Phase Constituents

6.3.1 Total Petroleum Hydrocarbons

The lateral extent of the TPH plume in the north-central, eastern, south-central, and southern offsite areas remains similar to the interpreted plumes for April 2016. A slight decrease in the TPH extent was interpreted for the southeastern area because TPH was not detected in offsite well GMW-O-24. TPH was detected in new monitoring wells GMW-67, GMW-68, and GMW-69 located in the eastern offsite area, but was not detected in wells GMW-63, GMW-64, and GMW-65 to the east, which bounds the extent of

impacts. TPH was not detected in the southern offsite area south of Cheshire Street, western offsite area, or in any Exposition aquifer wells during April 2016.

6.3.2 Benzene

Benzene was not detected in wells west of the site or in any of the Exposition aquifer wells. The lateral extent of dissolved benzene plume in the north-central area was similar to the April 2015 interpretation. Based on April 2016 data, dissolved benzene extends to the east of the site, as it was in wells GMW-67, GMW-68, and GMW-69, but was not detected in wells GMW-63, GMW-64, and GMW-65 to the east, which bounds the extent of impacts. In the south-central area a slight increase in extent was interpreted because benzene was detected in wells PZ-2, to the north of the main south-central area plume, and GMW-O-10, in the southern offsite area. Conversely, a decrease in the extent of the benzene plume in the southeastern area was interpreted because benzene was not detected in offsite wells GMW-O-16, GMW-O-24, and PZ-5.

6.3.3 1,2-Dichloroethane

The lateral extent of 1,2-DCA was similar to the April 2015 interpretation. 1,2-DCA was not detected in any of the wells in the eastern, southeastern, and southern offsite areas of the site. 1,2-DCA also was not detected in any of the Exposition aquifer wells during the semiannual monitoring event.

6.3.4 Methyl Tertiary Butyl Ether

Overall, the distribution of dissolved MTBE was similar to the interpretation for April 2015, with the exception that the south-central area plume was interpreted as one continuous plume that extends to the northwest to offsite well WCW-7. MTBE was not detected in any other wells west of the site. In the north-central/eastern area of the site, two isolated plumes were interpreted based on low-level detections of MTBE in GMW-21 and GMW-47, and GMW-50 and GMW-59. MTBE was not detected in any wells east of the site. The lateral extent of MTBE in the southeastern 24-inch-block valve area decreased slightly when compared with the extent interpreted for April 2015. This detection is based on decreases in MTBE concentration to nondetect in onsite well MW-8 and offsite well GMW-O-24. MTBE concentrations remained nondetect in offsite wells GMW-O-16, GMW-O-17, and GMW-O-19 during April 2016.

At Exposition aquifer well EXP-1, MTBE was detected in both split samples collected on behalf of SFPP and DLA Energy, as described in Section 2. Low-level detections of MTBE have been reported in EXP-1 during past events. MTBE was not detected in any other Exposition aquifer wells during the April 2016 monitoring event.

6.3.5 Tertiary Butyl Alcohol

The lateral extent of TBA across the site was interpreted to be less than the extent interpreted for April 2015. This is primarily due to the absence of TBA data for many wells in the eastern and north-central areas. A decrease in TBA concentration to nondetect was reported in wells GMW-47, GMW-60, and GMW-61, located in the eastern area. Similar to April 2015, TBA was also absent in the eastern and western offsite areas.

The lateral extent of TBA in the south-central portion of the site was similar to the extent interpreted for April 2015. The northern edge of the plume extends to the northwest at well MW-20 (MID) where the TBA concentration increased in April 2016. TBA was not detected in any offsite wells to the south.

In the southeastern area, the lateral extent of TBA was slightly less than the extent interpreted for April 2015. The decrease in extent was a result of TBA nondetects in offsite wells GMW-O-16 and GMW-O-24, and onsite well GMW-SF-7. TBA remained nondetect in offsite wells GMW-O-17 and GMW-O-19, and onsite wells MW-8, GMW-39, and GMW-SF-8 during the April 2016 monitoring event. SFPP will

continue to extract groundwater in the southeastern area for plume containment, and monitor for TBA and other constituents.

TBA was not detected in any Exposition aquifer wells during the April 2016 monitoring event.

6.3.6 Other Fuel Oxygenates

Other fuel oxygenates including ETBE, DIPE, and TAME were analyzed during the April 2016 semiannual event. ETBE and TAME were not detected in any of the samples collected in April 2016. DIPE was detected in eight wells located in the south-central area, West Side Barrier region, and the northwestern portion of the site. DIPE was detected in three of the five “MID” wells that were sampled. Fuel oxygenates will continue to be monitored, and results will be further assessed to determine if additional actions are necessary.

6.4 System Effectiveness

Based on the results presented in this report, it is believed that DLA Energy’s remediation systems in the north-central area and SFPP’s remediation systems in the south-central and southeastern areas are effectively containing dissolved-phase constituents across the site.

- The lateral extent of dissolved-phase plumes has been reduced from the historical maximum extent and currently appears to be stable and consistent with previous monitoring events. The reduction and current stability of the plumes is a result of hydraulic containment by the treatment systems and natural attenuation mechanisms. The hydraulic containment systems will continue to be operated.
- The magnitude and extent of free product in the south-central area has declined substantially since April 2015. It is believed that the decrease in product thickness and areal extent is a result of biosparge operations that has been implemented in the south-central area since January 2016. TFE and manual product removal from extraction wells will continue to be performed during the third and fourth quarters of 2016 to maximize product removal across the site.
- The low detections of MTBE and 1,2-DCA and the delineated plume extents in the western area do not warrant restarting the West Side Barrier treatment system. VOCs and TPH will continue to be monitored in this area.

Throughout 2016, DLA Energy will continue to conduct soil excavation activities across the site at shallow soil areas that exceed the approved soil cleanup goals. In the third and fourth quarters of 2016, DLA Energy will focus on completion of soil treatment and backfilling, and will resume deeper soil remediation.

Notes:

Biosparge and additional soil vapor extraction wells used for remediation purposes only are not listed here.

--- = information not available

CH2M HILL = CH2M HILL Engineers, Inc.

feet amsl = feet above mean sea level

feet bgs = feet below ground surface

FDGTI = Fluor Daniel GTI

GMX = Geomatrix Consultants, Inc.

GTI = Groundwater Technology/Groundwater Technology Government Services

GW = Golden West

HLA = Harding Lawson Associates

Parsons = Parsons Corporation

SGI = The Source Group, Inc.

WC = Woodward-Clyde

Notes:

DLA Energy and SFPP calculated groundwater elevation in wells with measurable product using the formula:

groundwater elevation = (top of casing elevation - depth to water) + apparent product thickness X specific gravity.

Product specific gravity of 0.8 was used for calculations in this table for DLA wells.

Product specific gravity ranging between 0.75 and 0.83 was used for calculations in this table for SFPP wells.

The soil vapor extraction and total fluids extraction systems in the south-central, southeastern, and north-central areas were offline 1 week prior to semiannual gauging activities.

--- = not detected or applicable

DRY = No measurable water observed in the well

feet amsl = feet above mean sea level, based on Los Angeles County Datum, 1980

feet btoc = feet below top of casing

NC = Not calculated

NM = Not measured

Notes:

< = not detected at or above the laboratory reporting limit shown

1,2-DCA = 1,2-dichloroethane

DIPE = di-isopropyl ether

ETBE = ethyl tertiary butyl ether

MTBE = methyl tertiary butyl ether

TAME = tertiary amyl methyl ether

TBA = tertiary butyl alcohol

TPH-g = total purgeable petroleum hydrocarbons quantified using a gasoline standard

TPH-d = total extractable petroleum hydrocarbons quantified using a diesel standard

Xylenes = total of m,p-xylene and o-xylene when detected

Figure 3

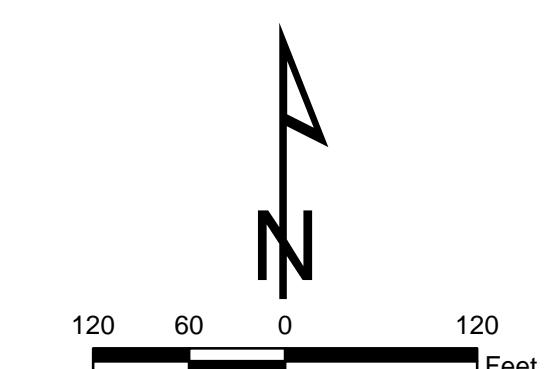

Explanation

- GMW-# ● Monitoring well and designation
- VIEW-1 ↓ Vapor extraction, groundwater extraction, total fluids, or free product extraction well used for site remediation
- TF-23 0.27 ‡ Apparent thickness of free product measured in well (feet)
- TF-17 ● Decommissioned Well
- TPH [TPHg and TPHd]**
results in micrograms per liter ($\mu\text{g/L}$) for the three most recent semiannual events; where the database is shown in white, the concentration of TPH has remained similar (concentration change is less than 10%) at that location since the first semiannual monitoring event of the previous year, or the dataset shown does not provide a basis for comparison.
- GMW-63 04/15 <000 10/15 <000 04/16 <000 Where the database is shown in red, the concentration of TPH has increased by 10% or more at that location since the first semiannual monitoring event of the previous year.
- GMW-60 04/15 3.0 10/15 4.40 04/16 2.0 Where the database is shown in blue, the concentration of TPH has decreased by 10% or more at that location since the first semiannual monitoring event of the previous year.
- <100 Not detected at or above laboratory reporting limit shown
- Not sampled/not analyzed
- <100/100 Primary sample analytical result/duplicate sample analytical result ($\mu\text{g/L}$)
- ND — Estimated extent of detected dissolved TPH in groundwater (concentration dependent on laboratory reporting limit); dashed where inferred
- 1,000 — Lines of equal TPH concentration ($\mu\text{g/L}$) in groundwater; dashed where inferred
- Estimated extent of measurable light nonaqueous phase liquid (LNAPL, free product) on groundwater; dashed where inferred

Survey Notes

1. Base map prepared from data provided by Fluor Daniel GTI, Dulin & Boynton, Geomatics, and Parsons.
2. Except as noted below, well locations surveyed by Dulin & Boynton
3. Locations of wells HL-3, and HL-4 based on field measurements by Fluor Daniel GTI and Woodward-Clyde.
4. Locations of wells BW-1 through BW-9 surveyed by Geomatics based on reference to other wells surveyed by Dulin & Boynton.

Survey Notes

- Base map prepared from data provided by Fluor Daniel GTI, Dulin & Boynton, Geomatix, and Parsons.
- Except as noted below, well locations surveyed by Dulin & Boynton.
- Locations of wells HL-3, and HL-4 based on field measurements by Fluor Daniel GTI and Woodward-Clyde.
- Locations of wells BW-1 through BW-9 surveyed by Geomatix based on reference to other wells surveyed by Dulin & Boynton.

**TERTIARY BUTYL ALCOHOL IN
UPPERMOST GROUNDWATER ZONE**
April 2016

DFSP NORWALK
Norwalk, California

By: Michael Deseo Date: 6/2016 Project No: 406972

WCW-14	04/20/15	78.81	---	35.09	---	43.72
WCW-14	10/19/15	78.81	---	35.71	---	43.10
WCW-14	04/11/16	78.81	---	36.22	---	42.59

Notes:

--- = not detected or applicable

DRY – No measurable water observed in the well.

feet btoc = feet below top of casing

feet amsl = feet above mean sea level, based on Los Angeles County Datum, 1980

NC = not calculated

NM = not measured

Notes:

< = not detected at or above the laboratory reporting limit shown

--- = not analyzed

1,2-DCA = 1,2-dichloroethane

b or HD = Chromatographic pattern was inconsistent with the profile of the reference fuel standard.

DIPE = di-isopropyl ether

ETBE = ethyl tertiary butyl ether

J = The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

MTBE = methyl tertiary butyl ether

TAME = tertiary amyl methyl ether

TBA = tertiary butyl alcohol

TPH-d = total extractable petroleum hydrocarbons quantified using a diesel standard

TPH-fp = total extractable petroleum hydrocarbons quantified using a site fuel product standard

TPH-g = total purgeable petroleum hydrocarbons quantified using a gasoline standard

TPH-jp₄ = total extractable petroleum hydrocarbons quantified as Jet Propellant 4

TPH-jp₅ = total extractable petroleum hydrocarbons quantified as Jet Propellant 5

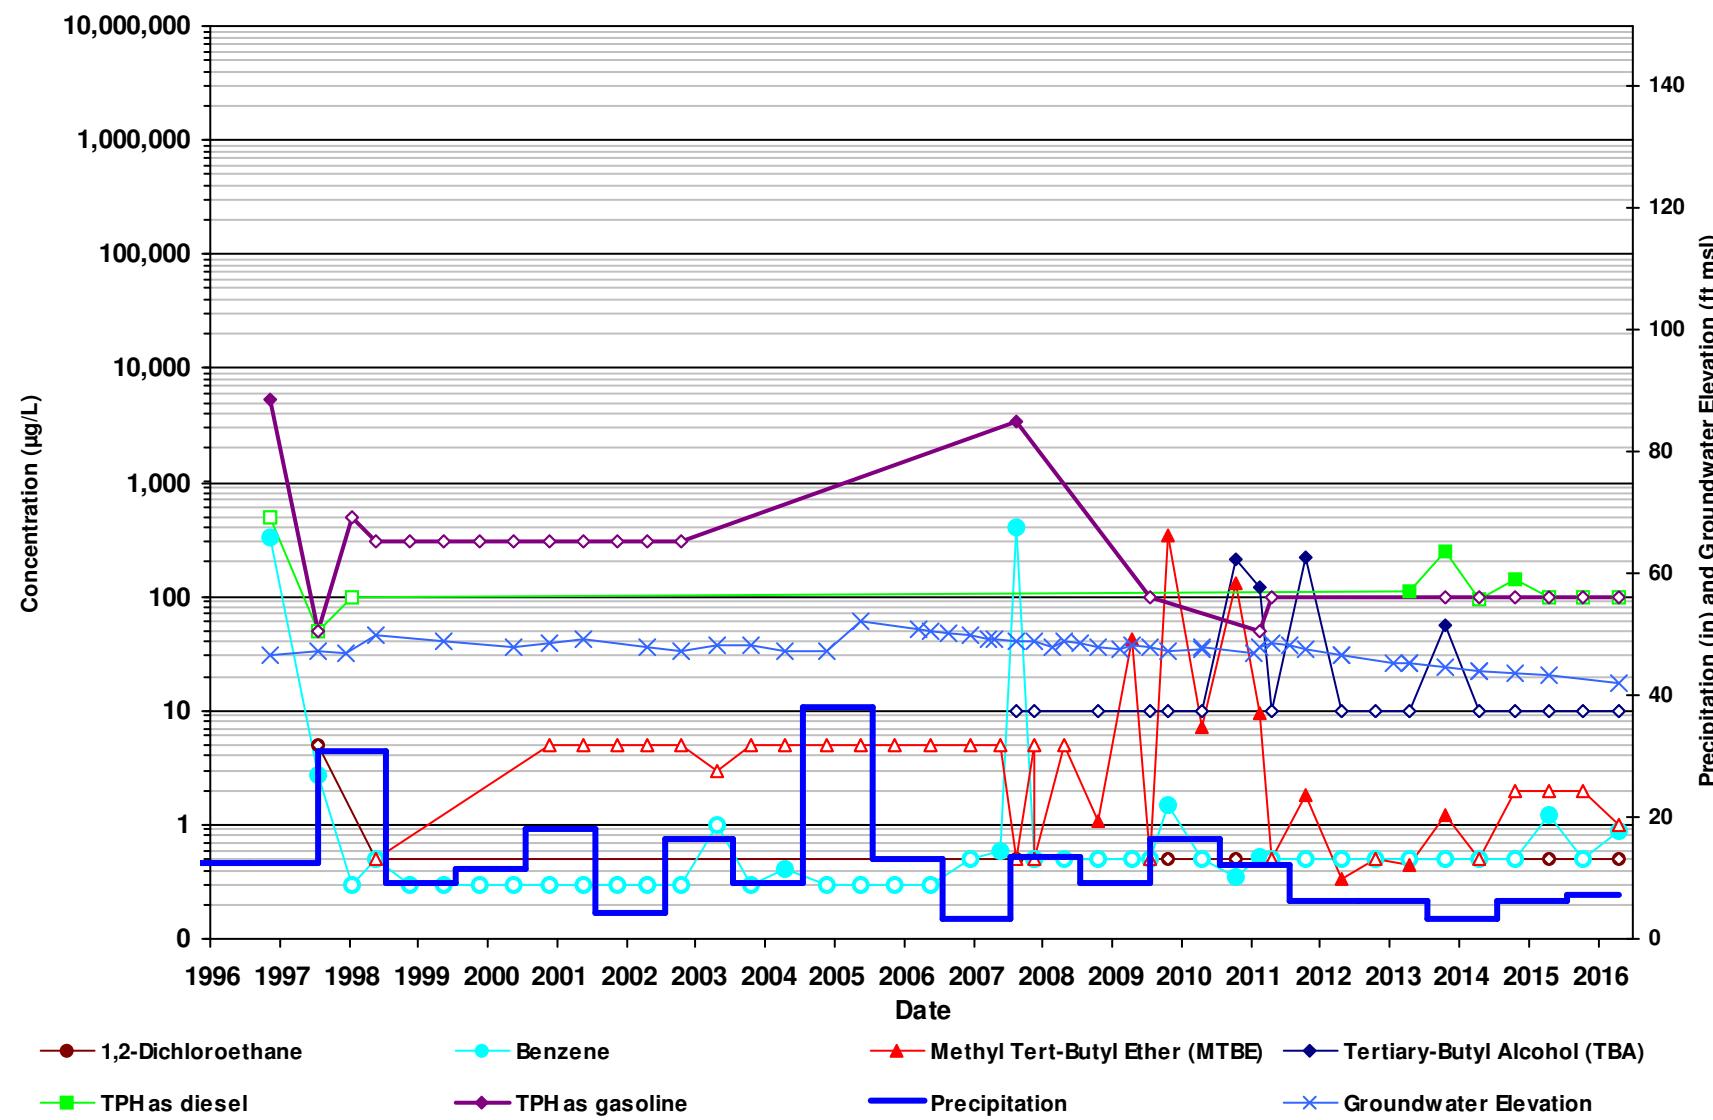

Xylenes = total of m,p-xylene and o-xylene when detected

Time Series Charts

Former Tank Farm Area
GMW-6, GMW-15, GMW-32,
GMW-45, GMW-47,
MW-23 (MID), MW-26

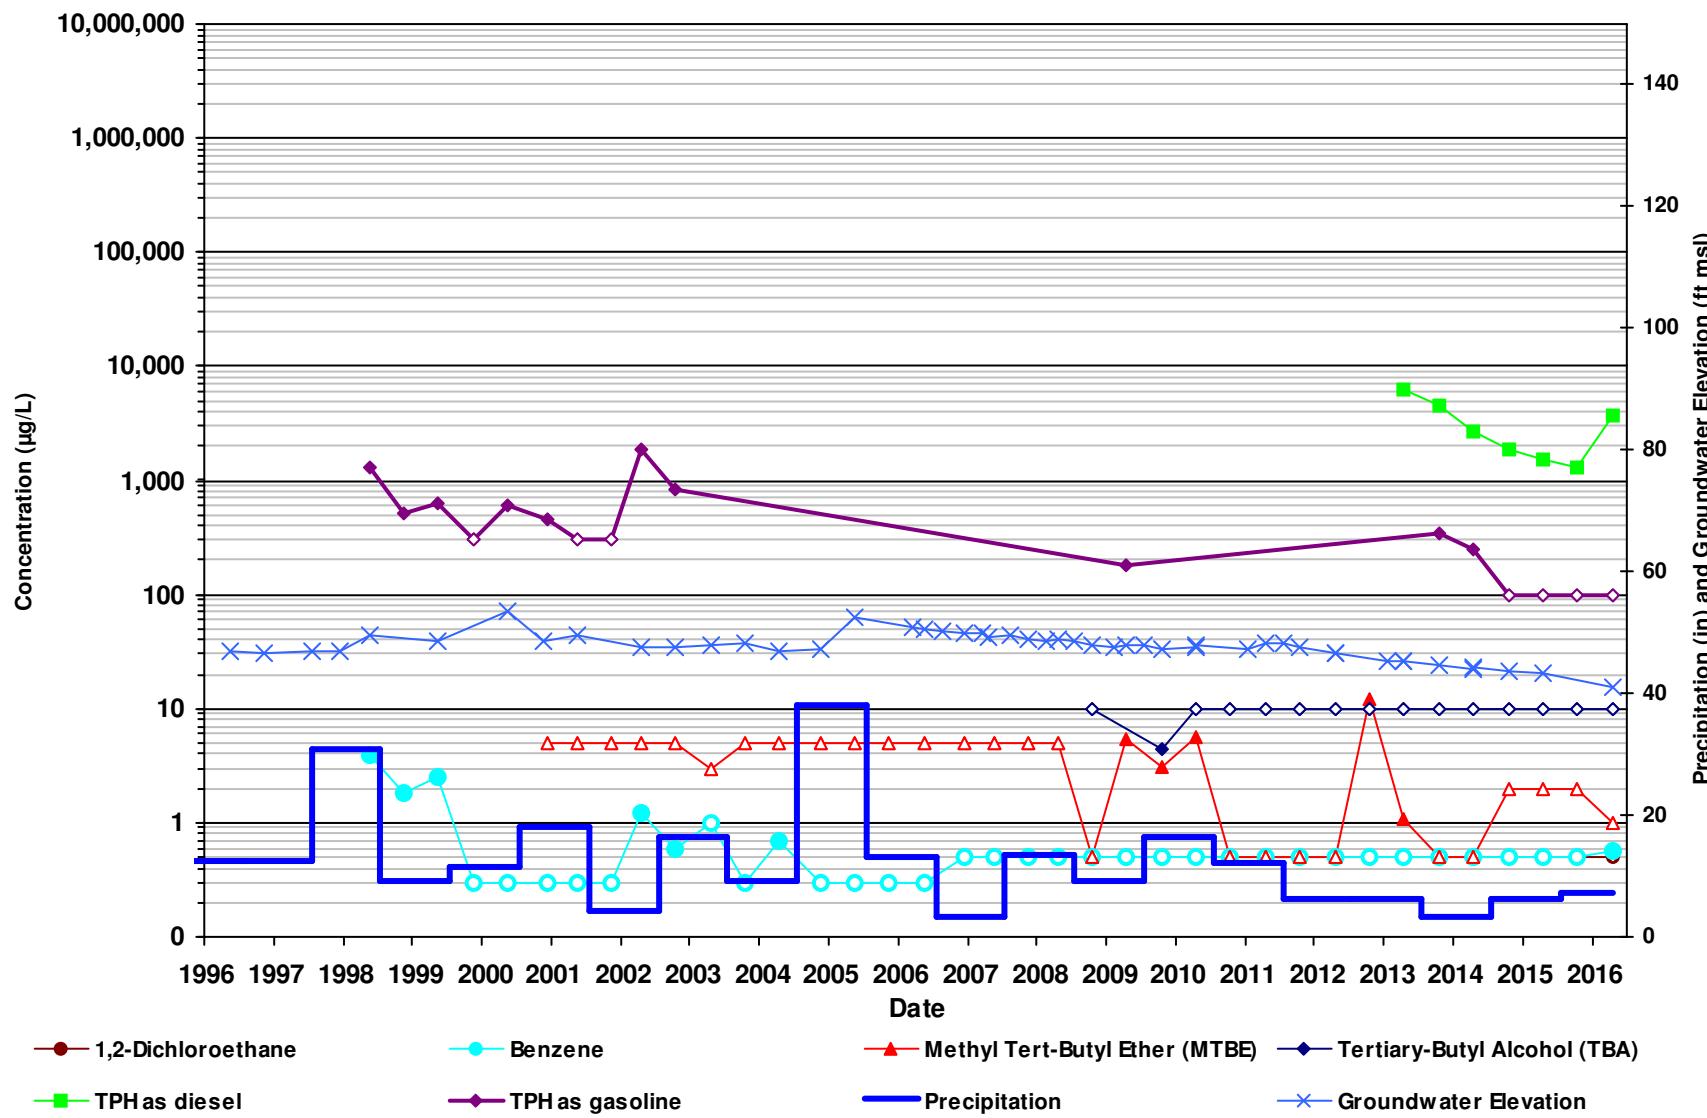

GMW-6

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

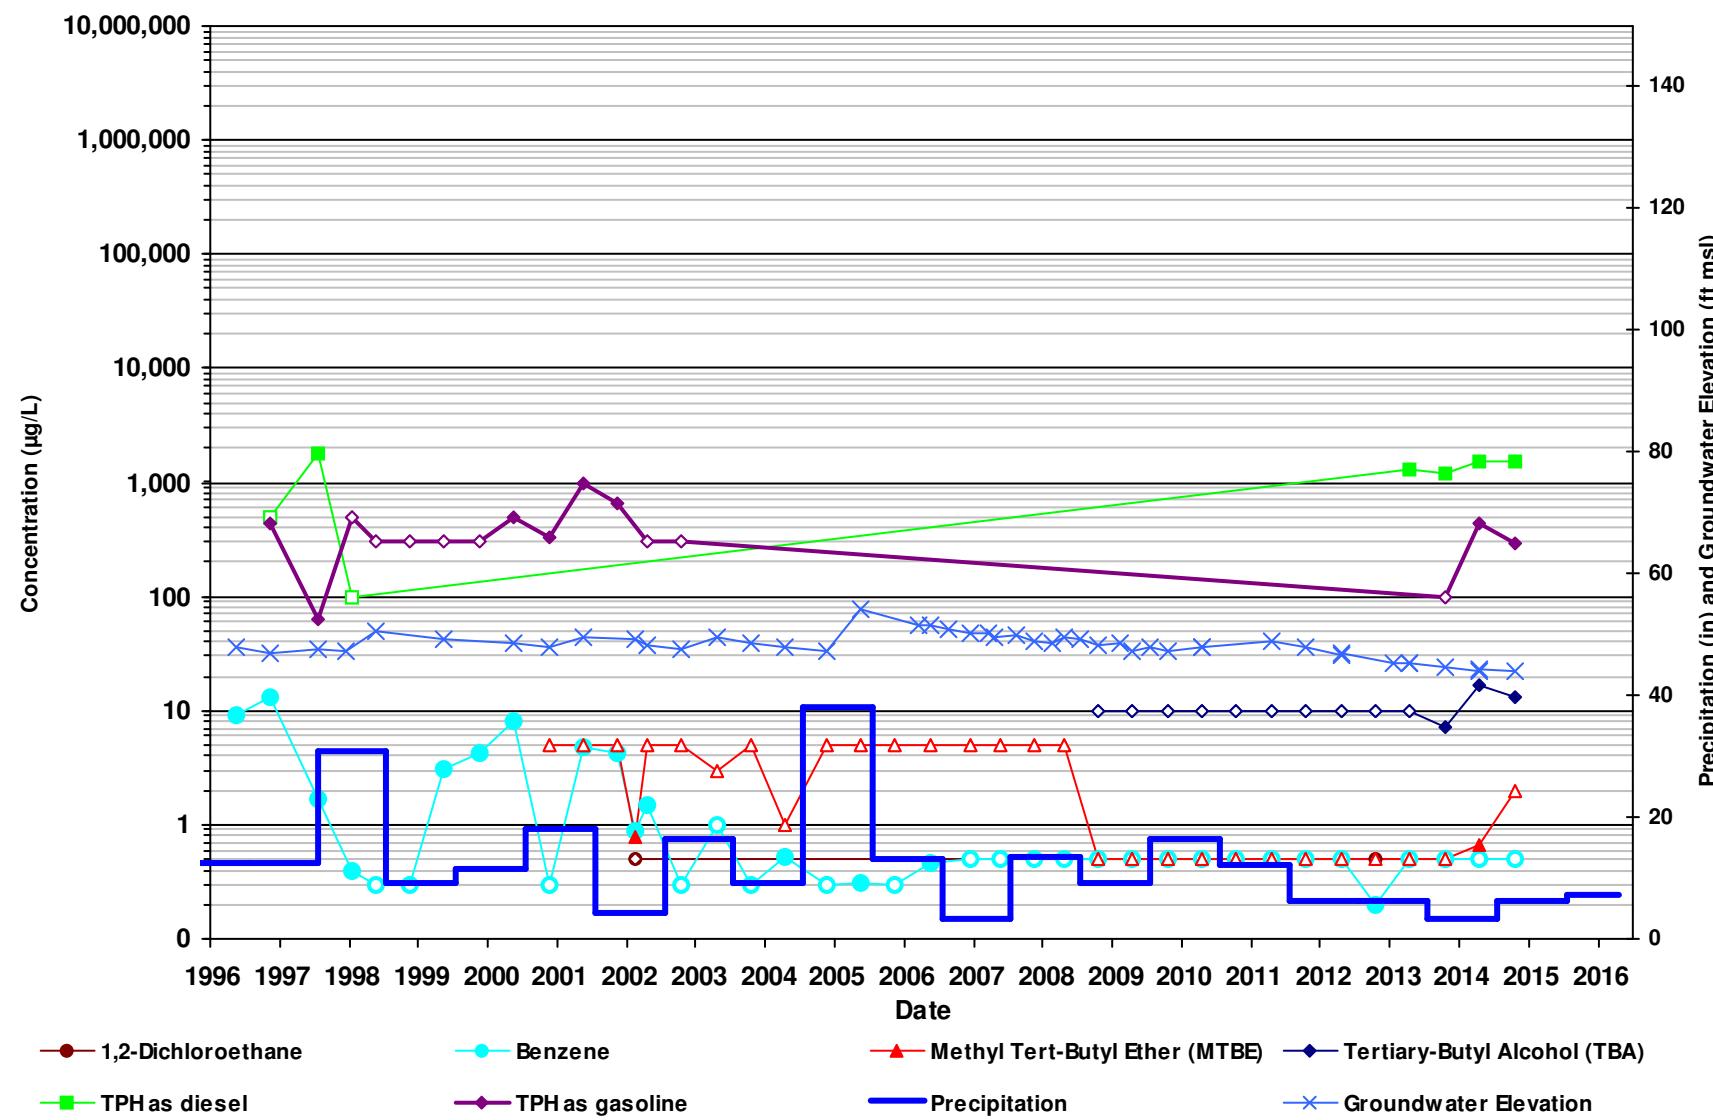

GMW-15

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

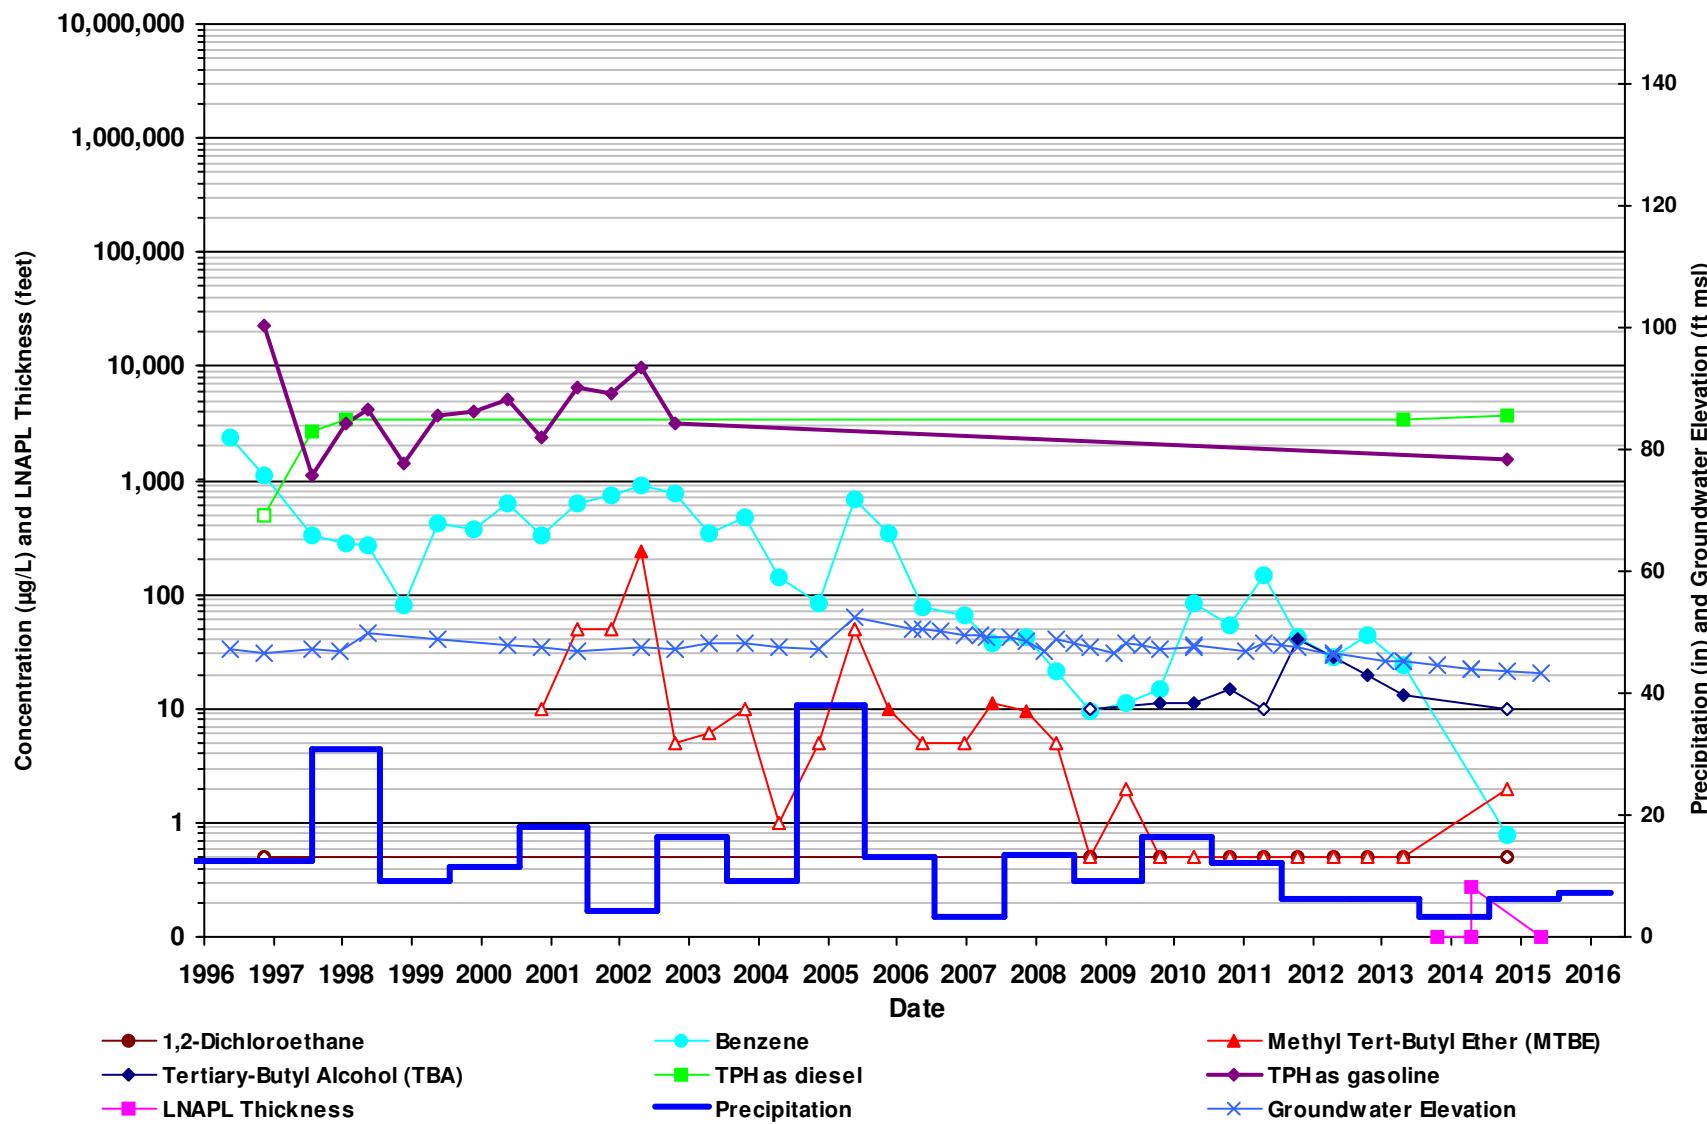

GMW-32

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

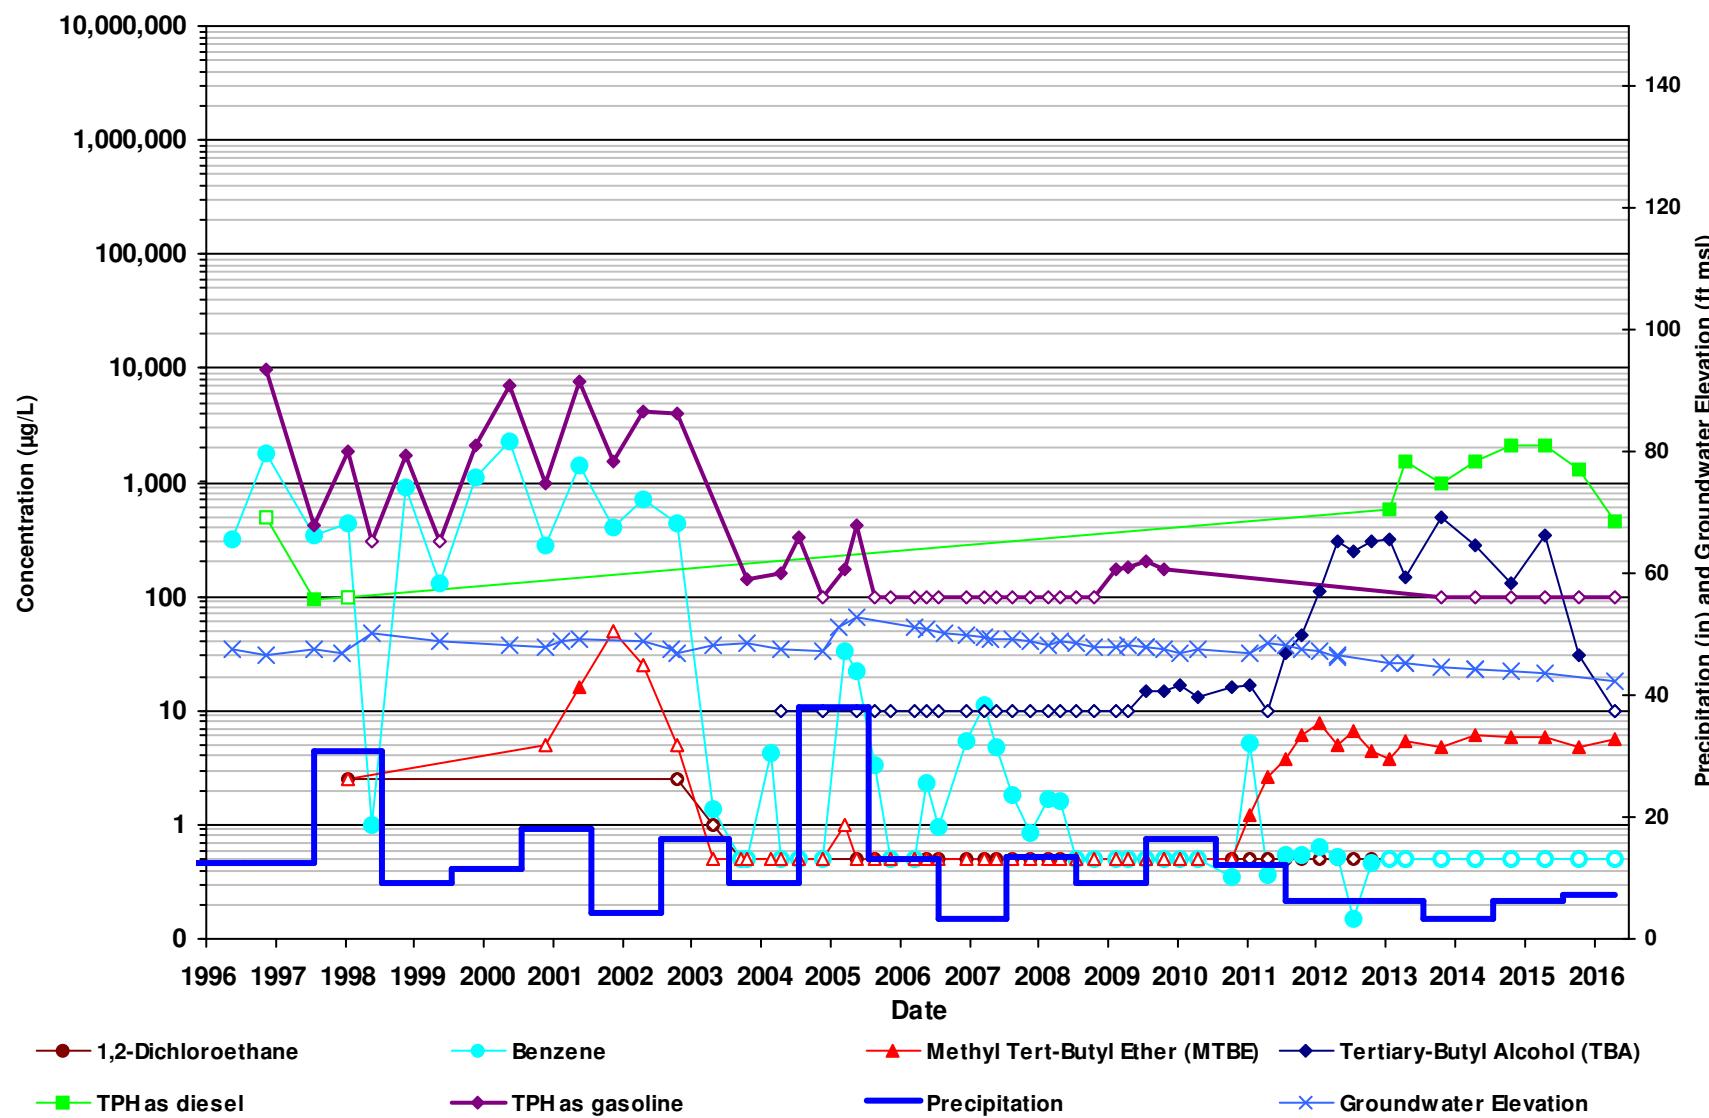

GMW-45

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

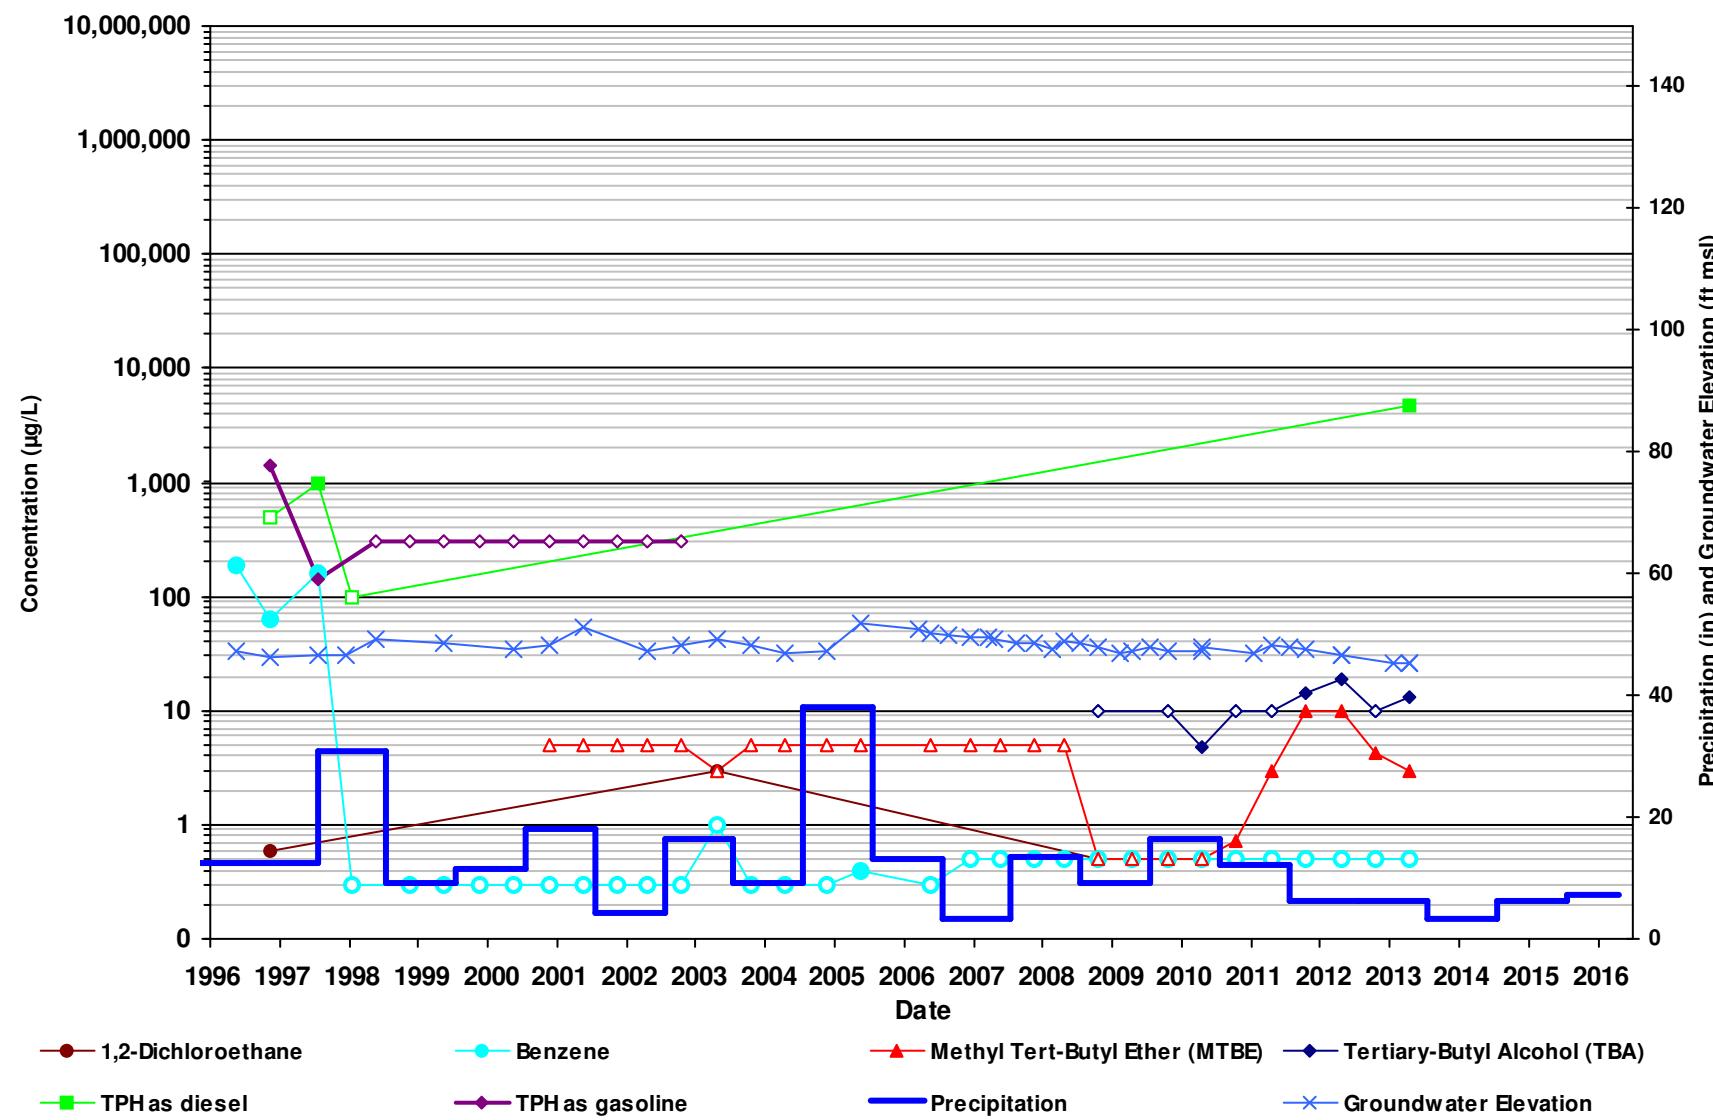

GMW-47

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

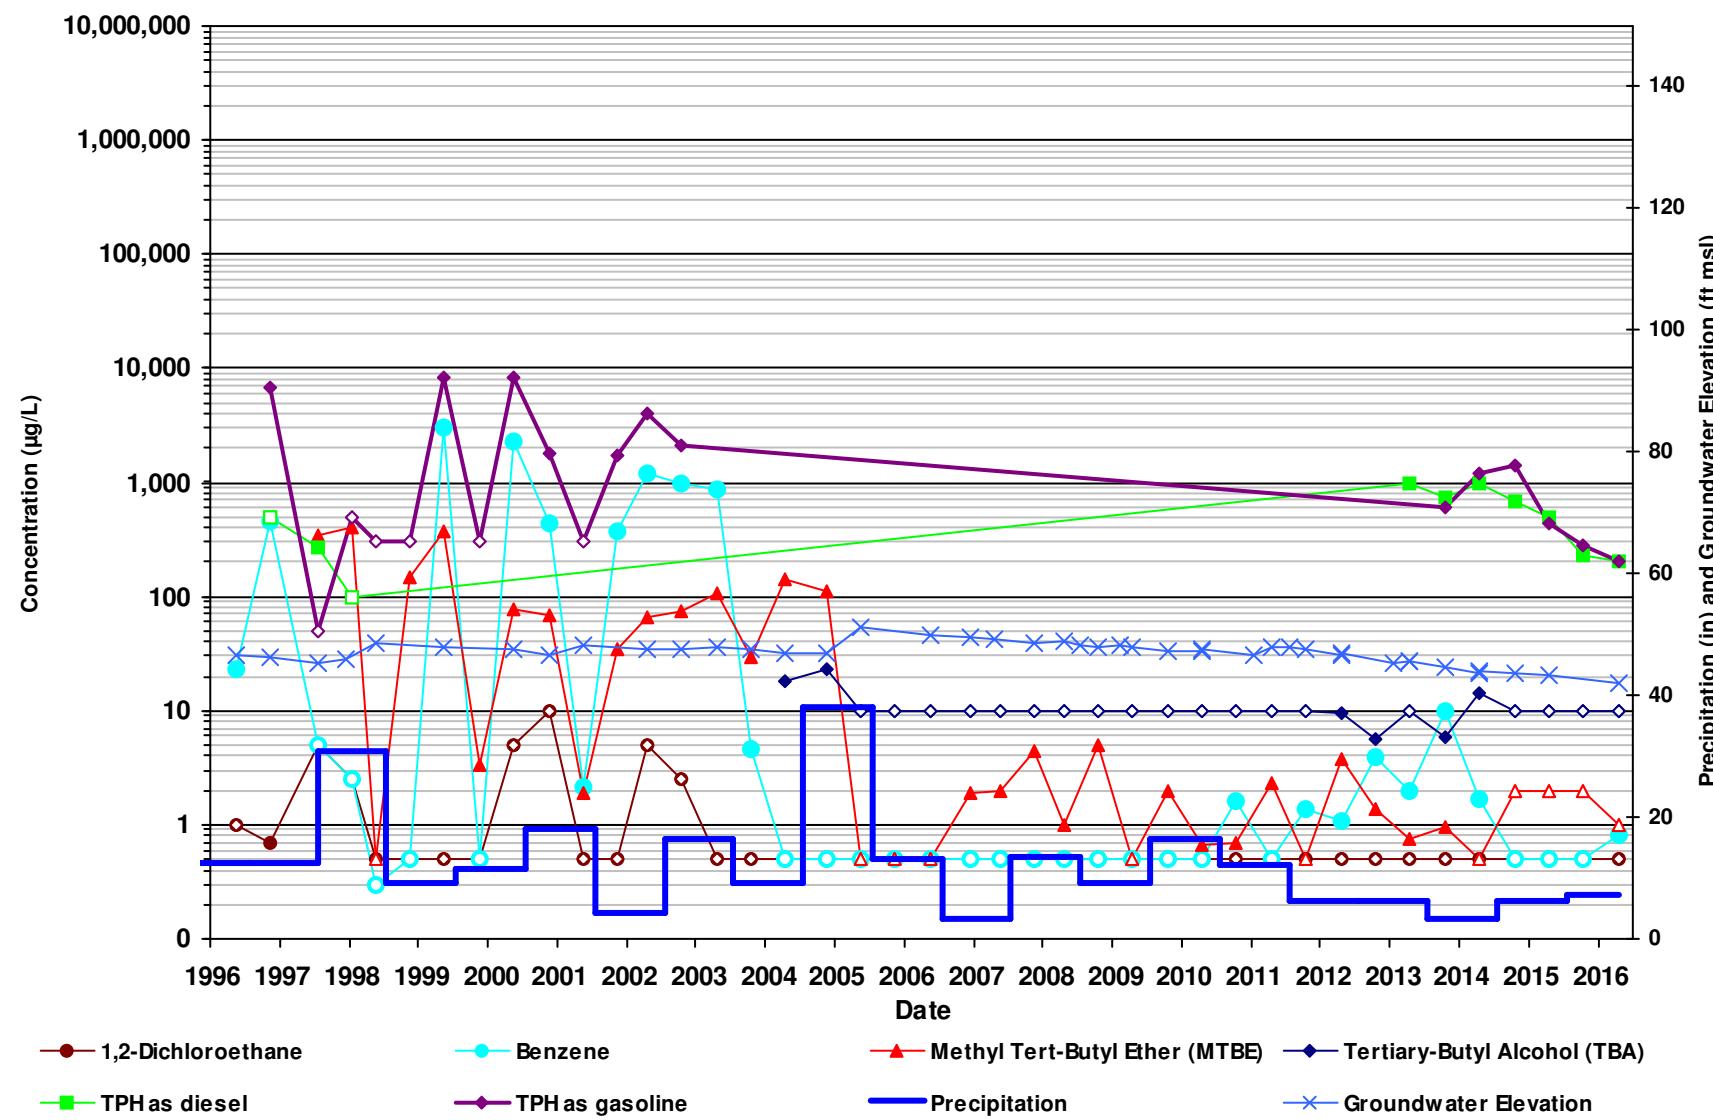

MW-23 (MID)

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

MW-26

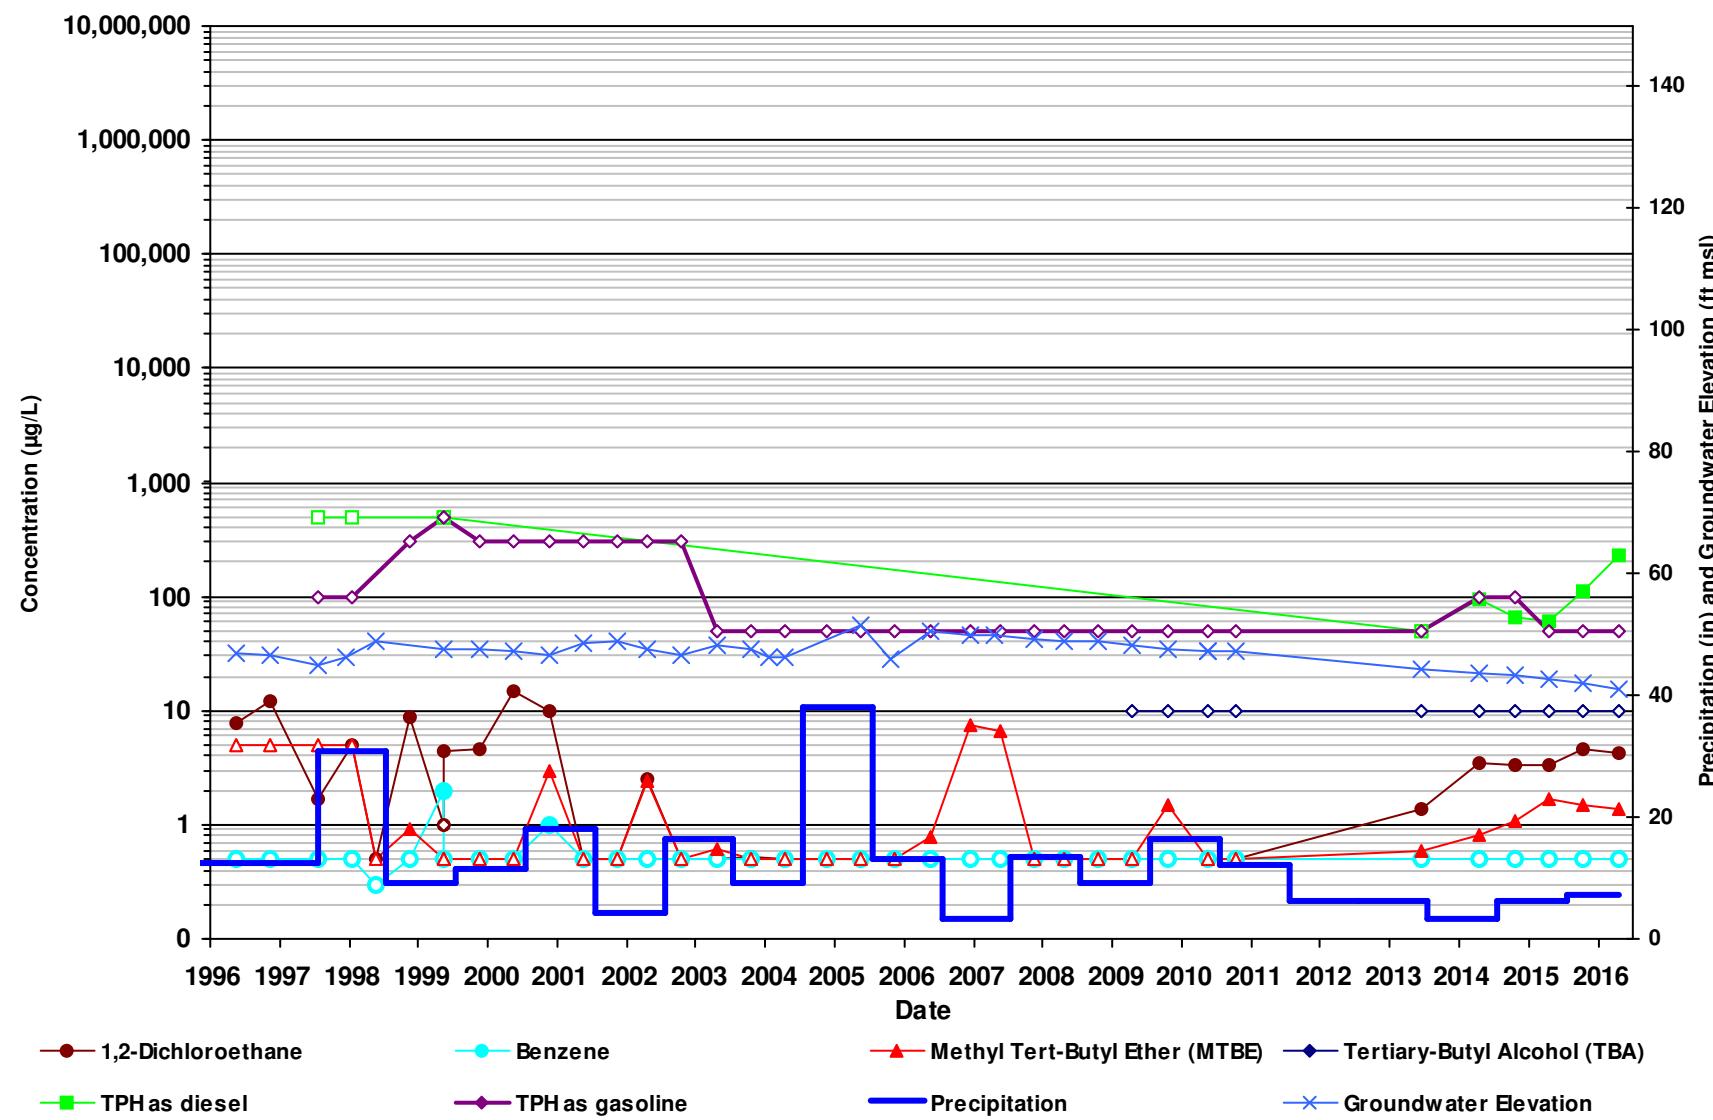

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

Western Area
GMW-8, GW-2, GW-6, GW-13, MW-6,
MW-7, MW-20 (MID), MW-22 (MID),

GMW-8

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

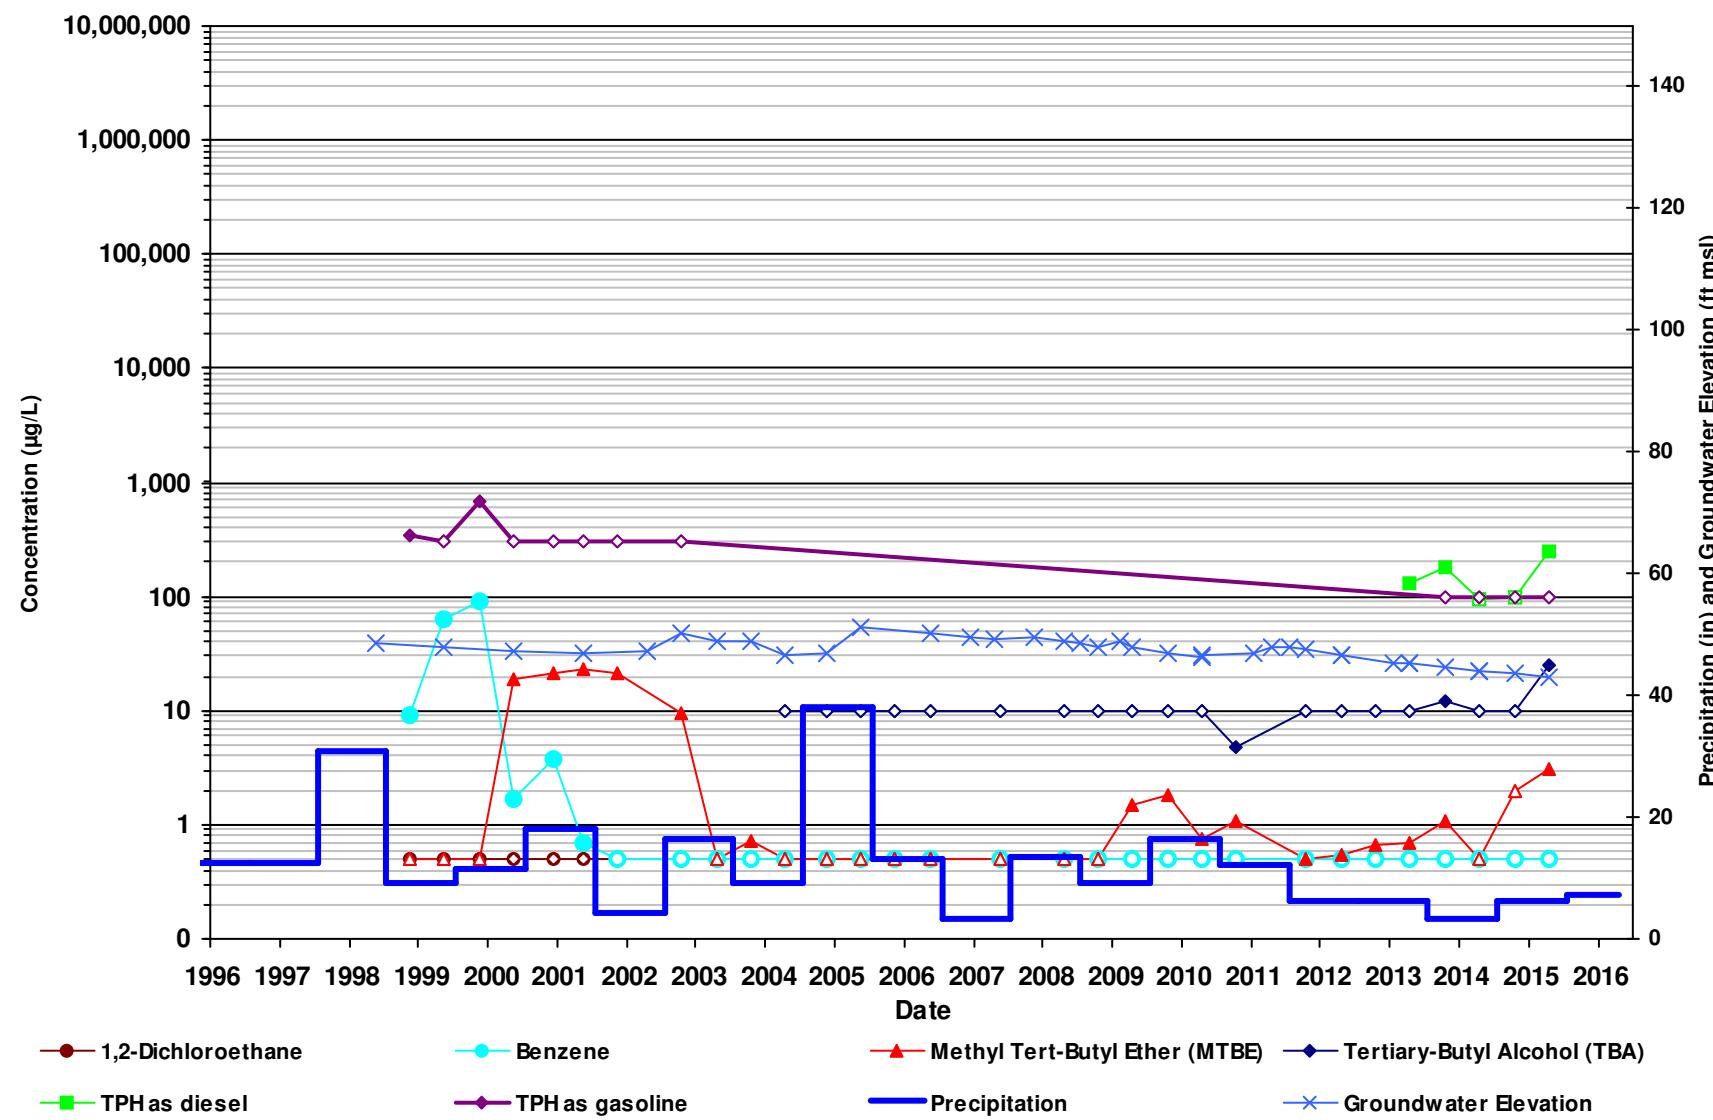

GW-2

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

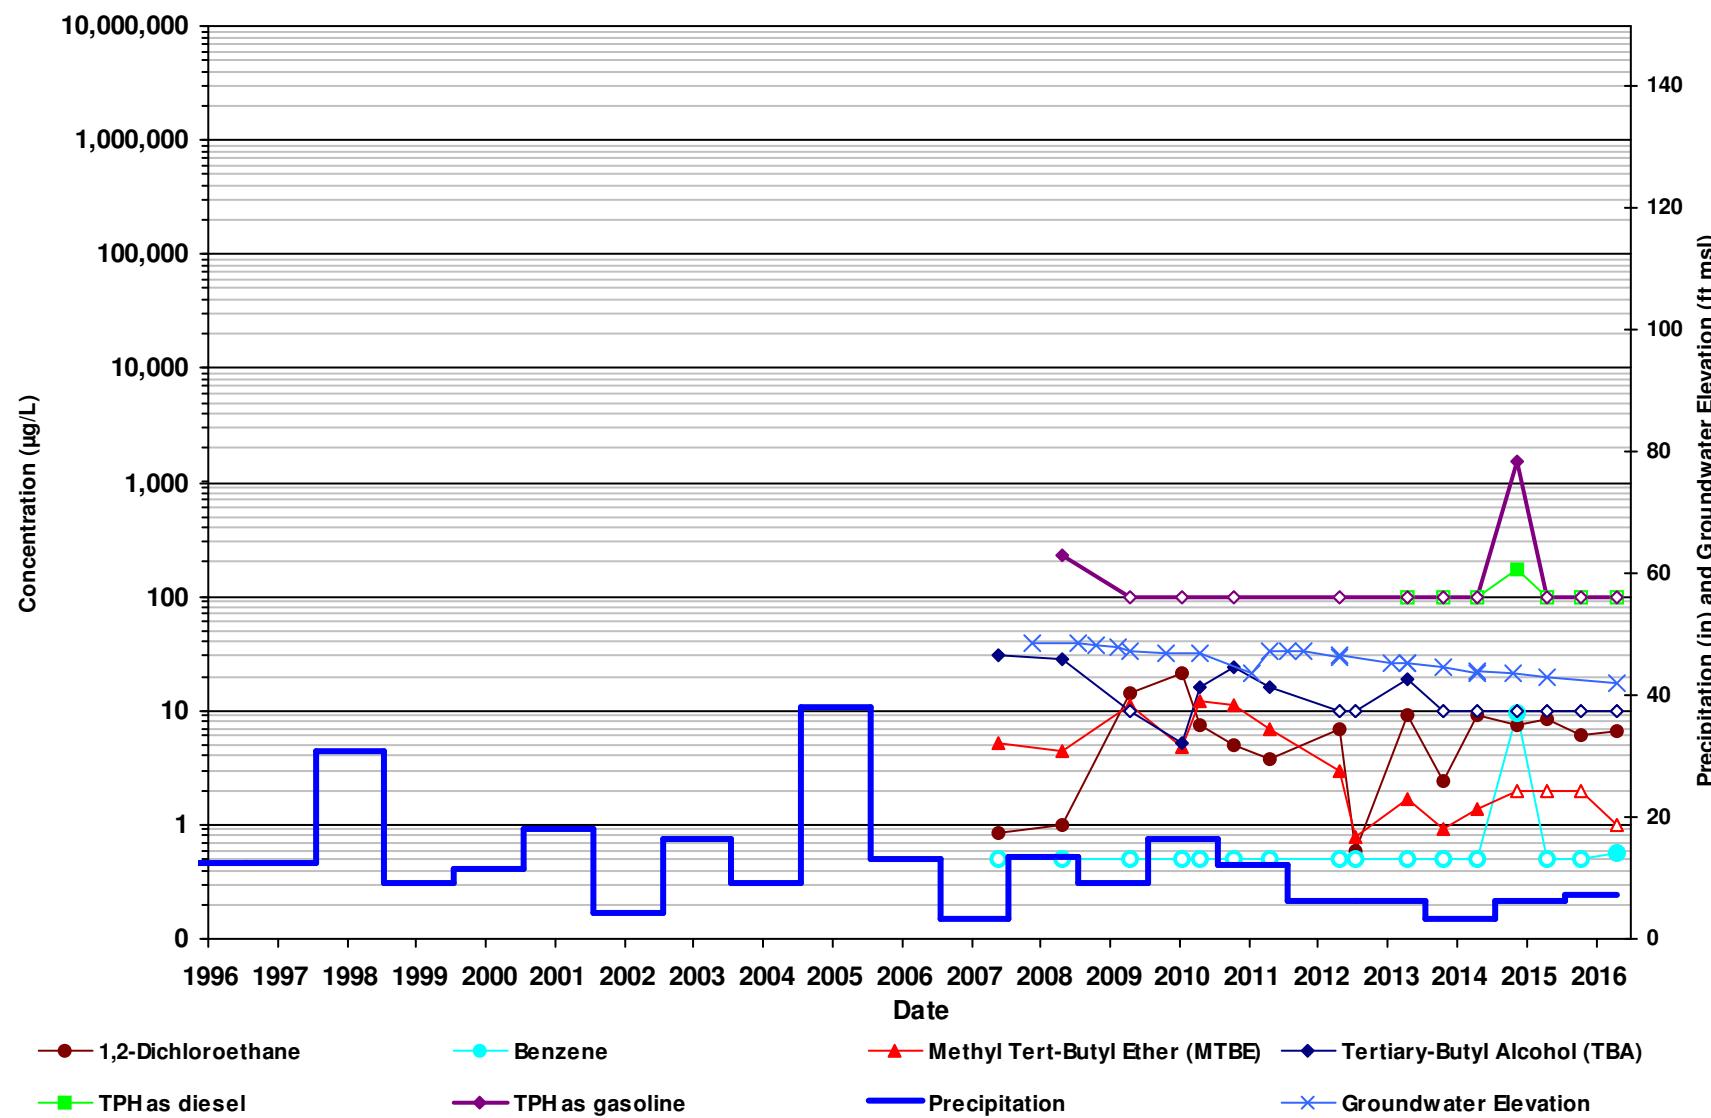

GW-6

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

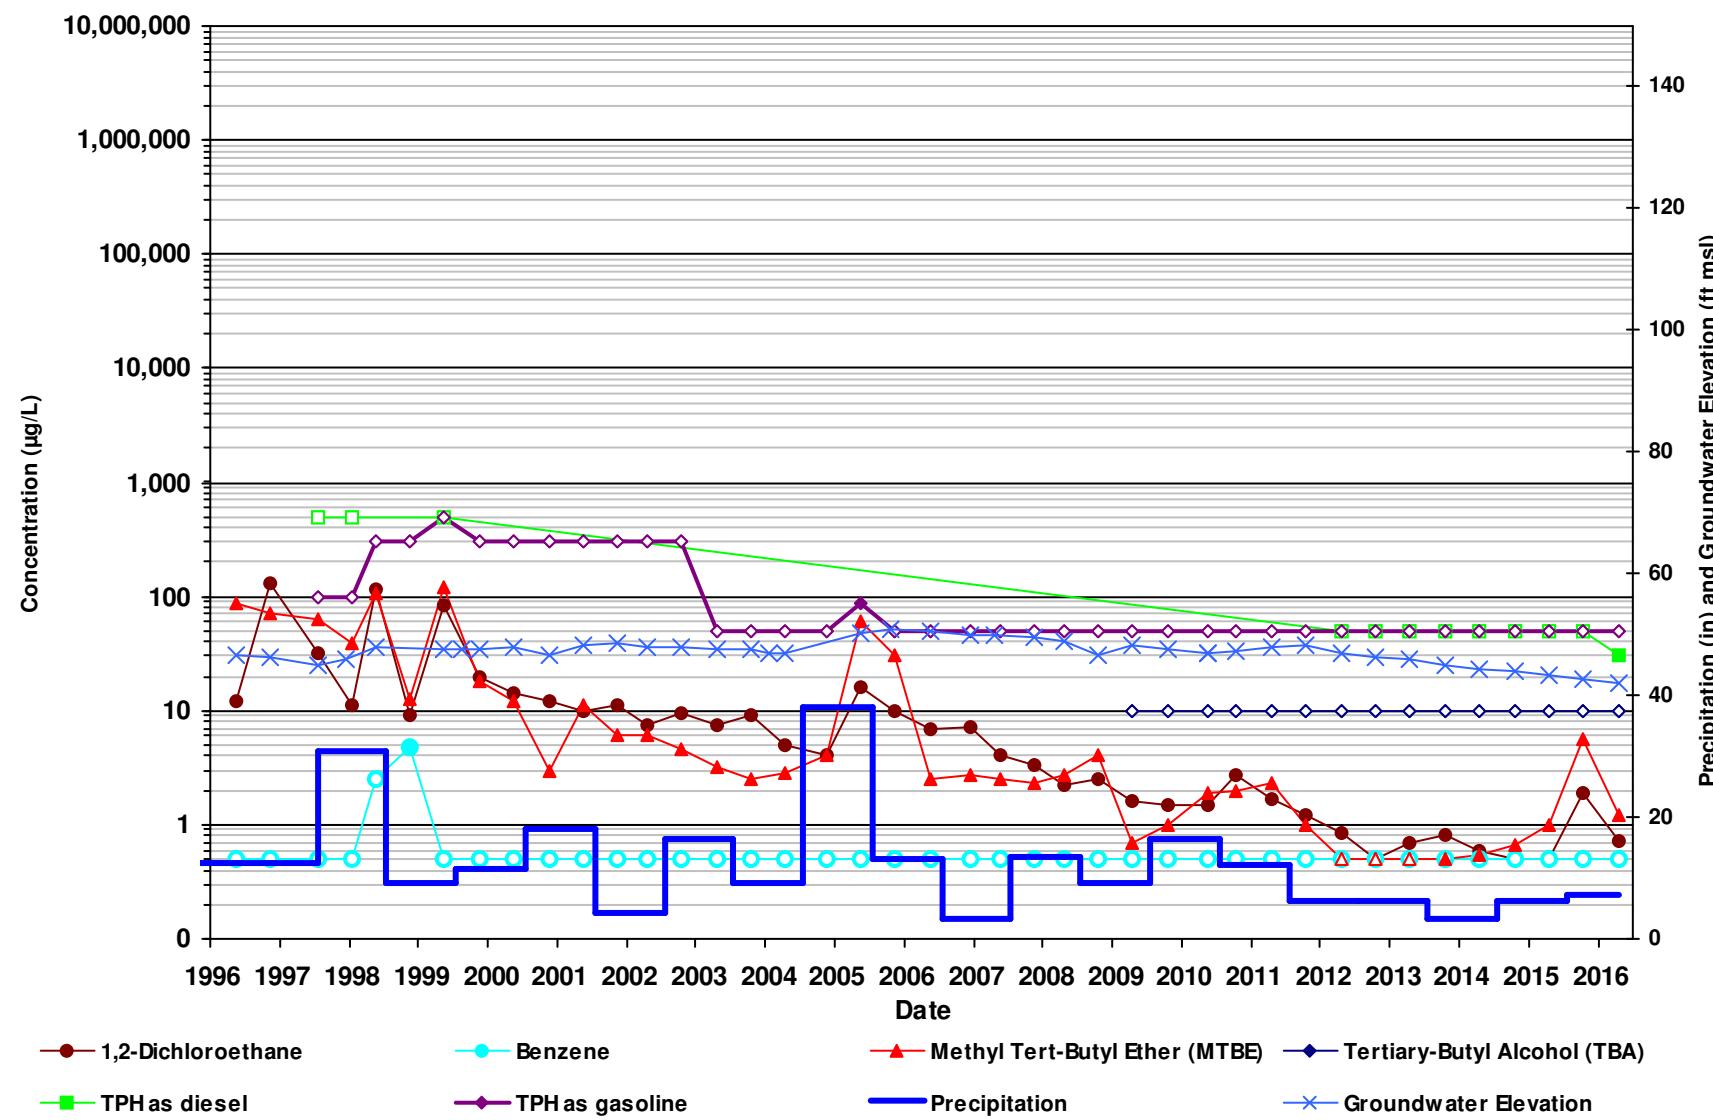

GW-13(6")

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

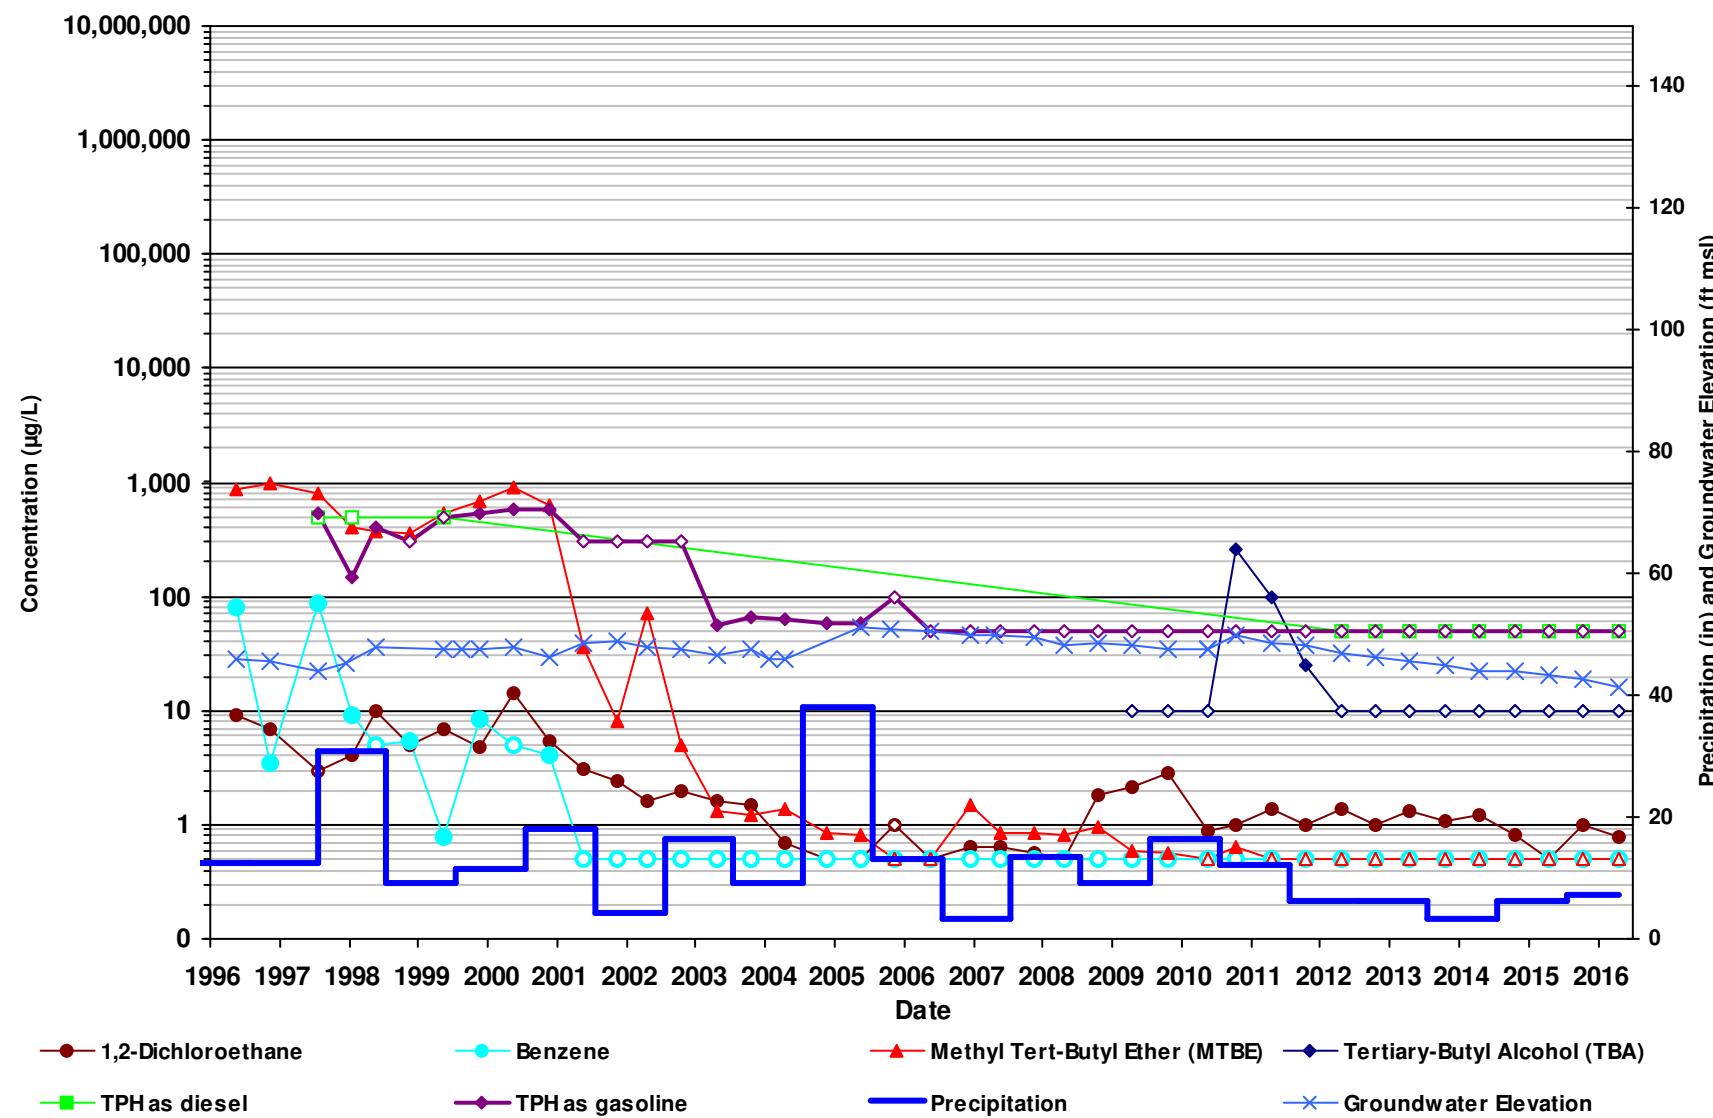

MW-6

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

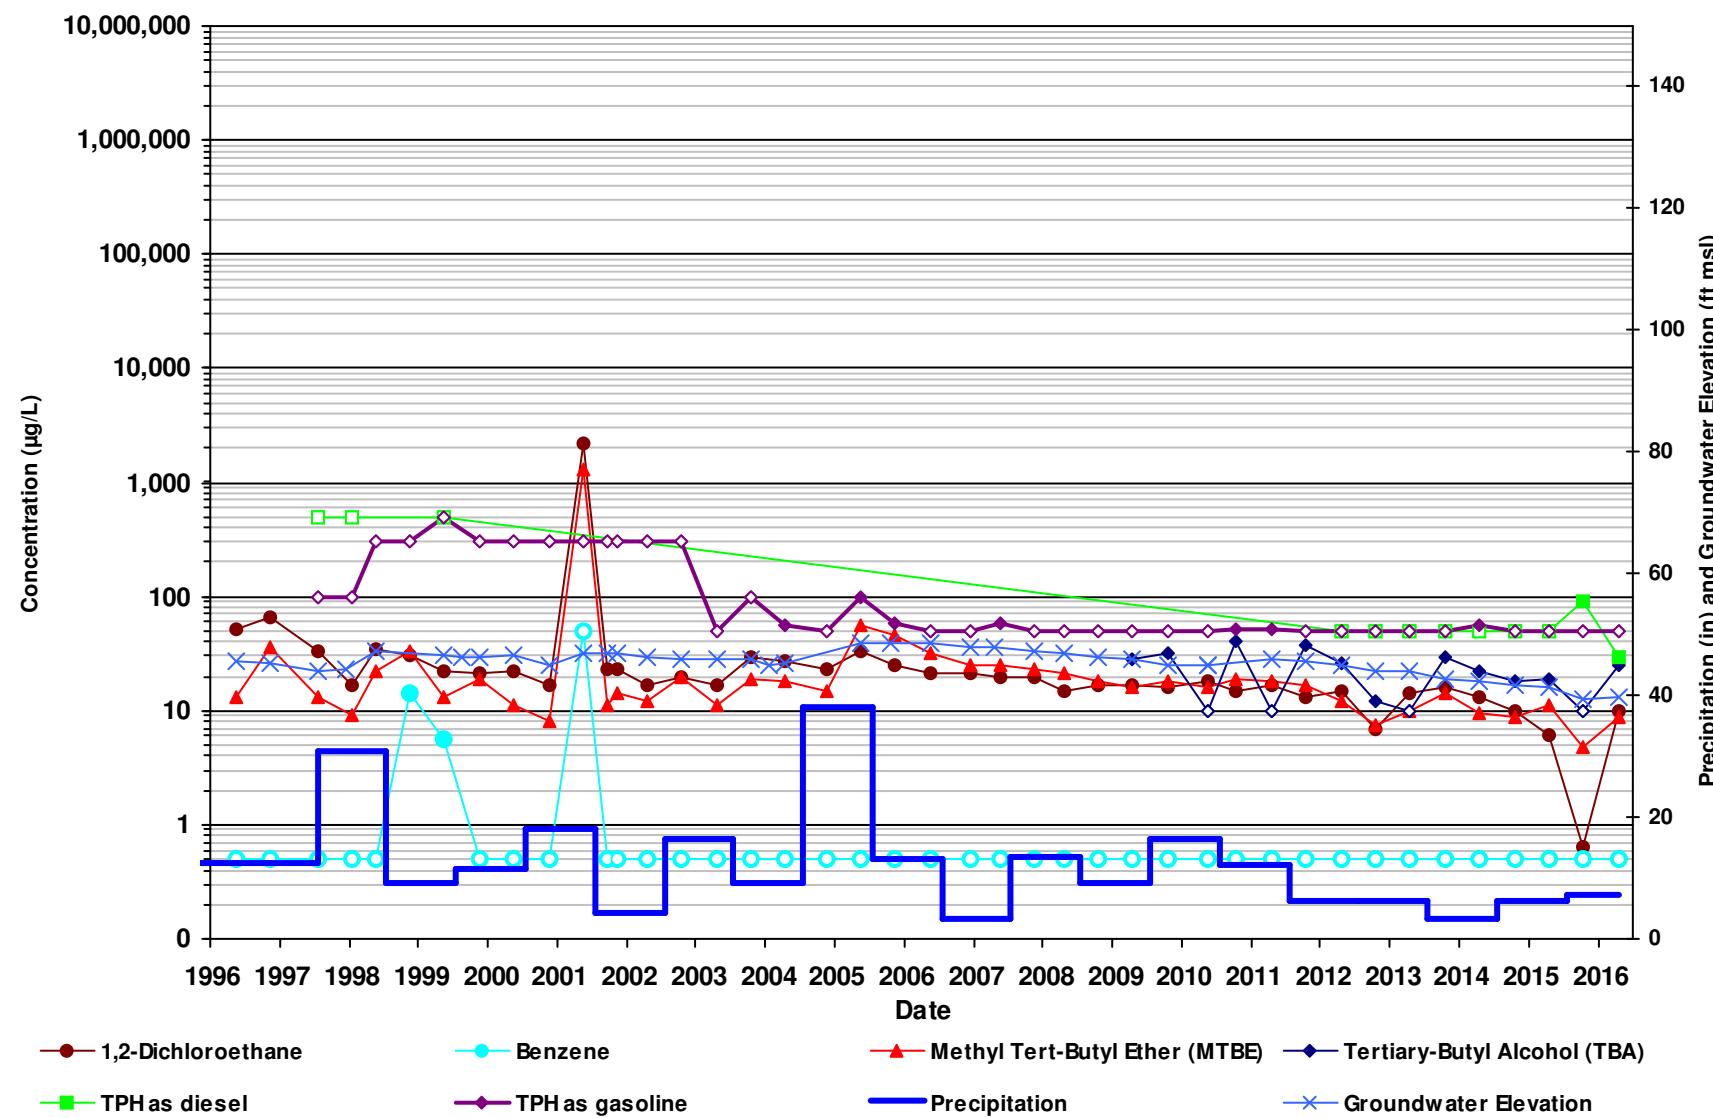

MW-7

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

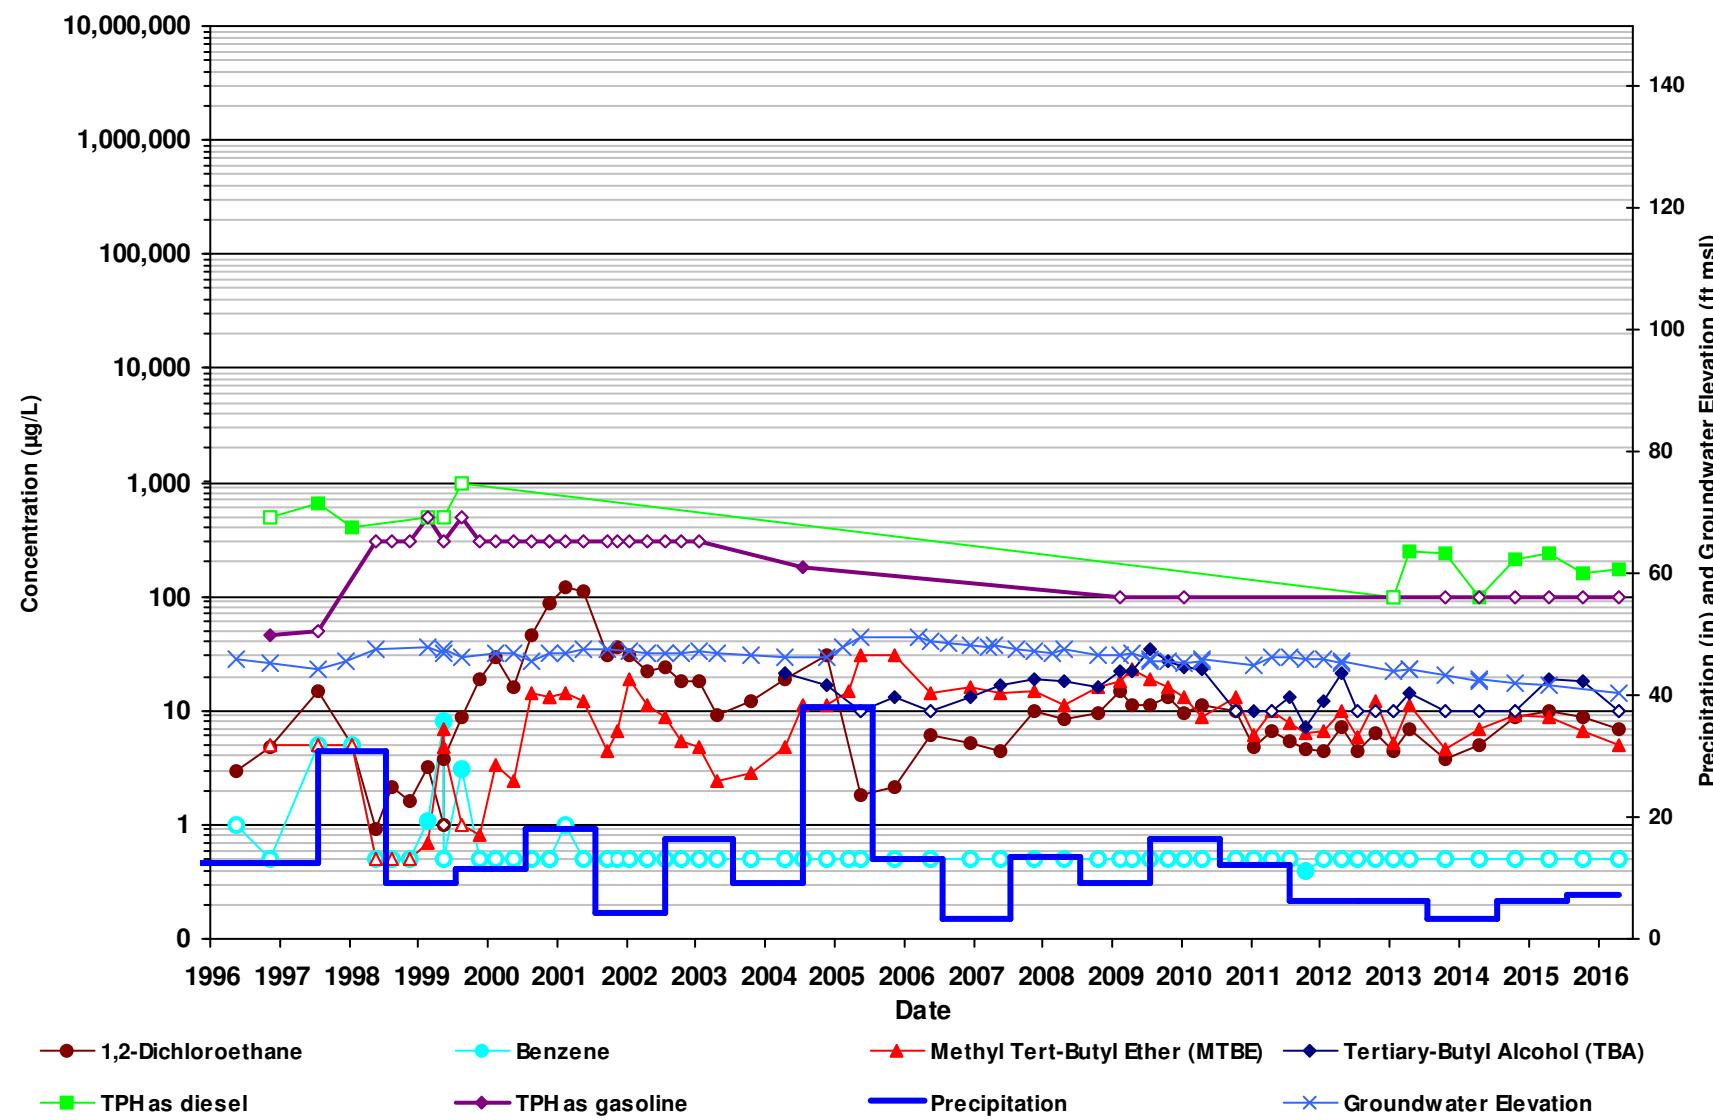

MW-20 (MID)

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

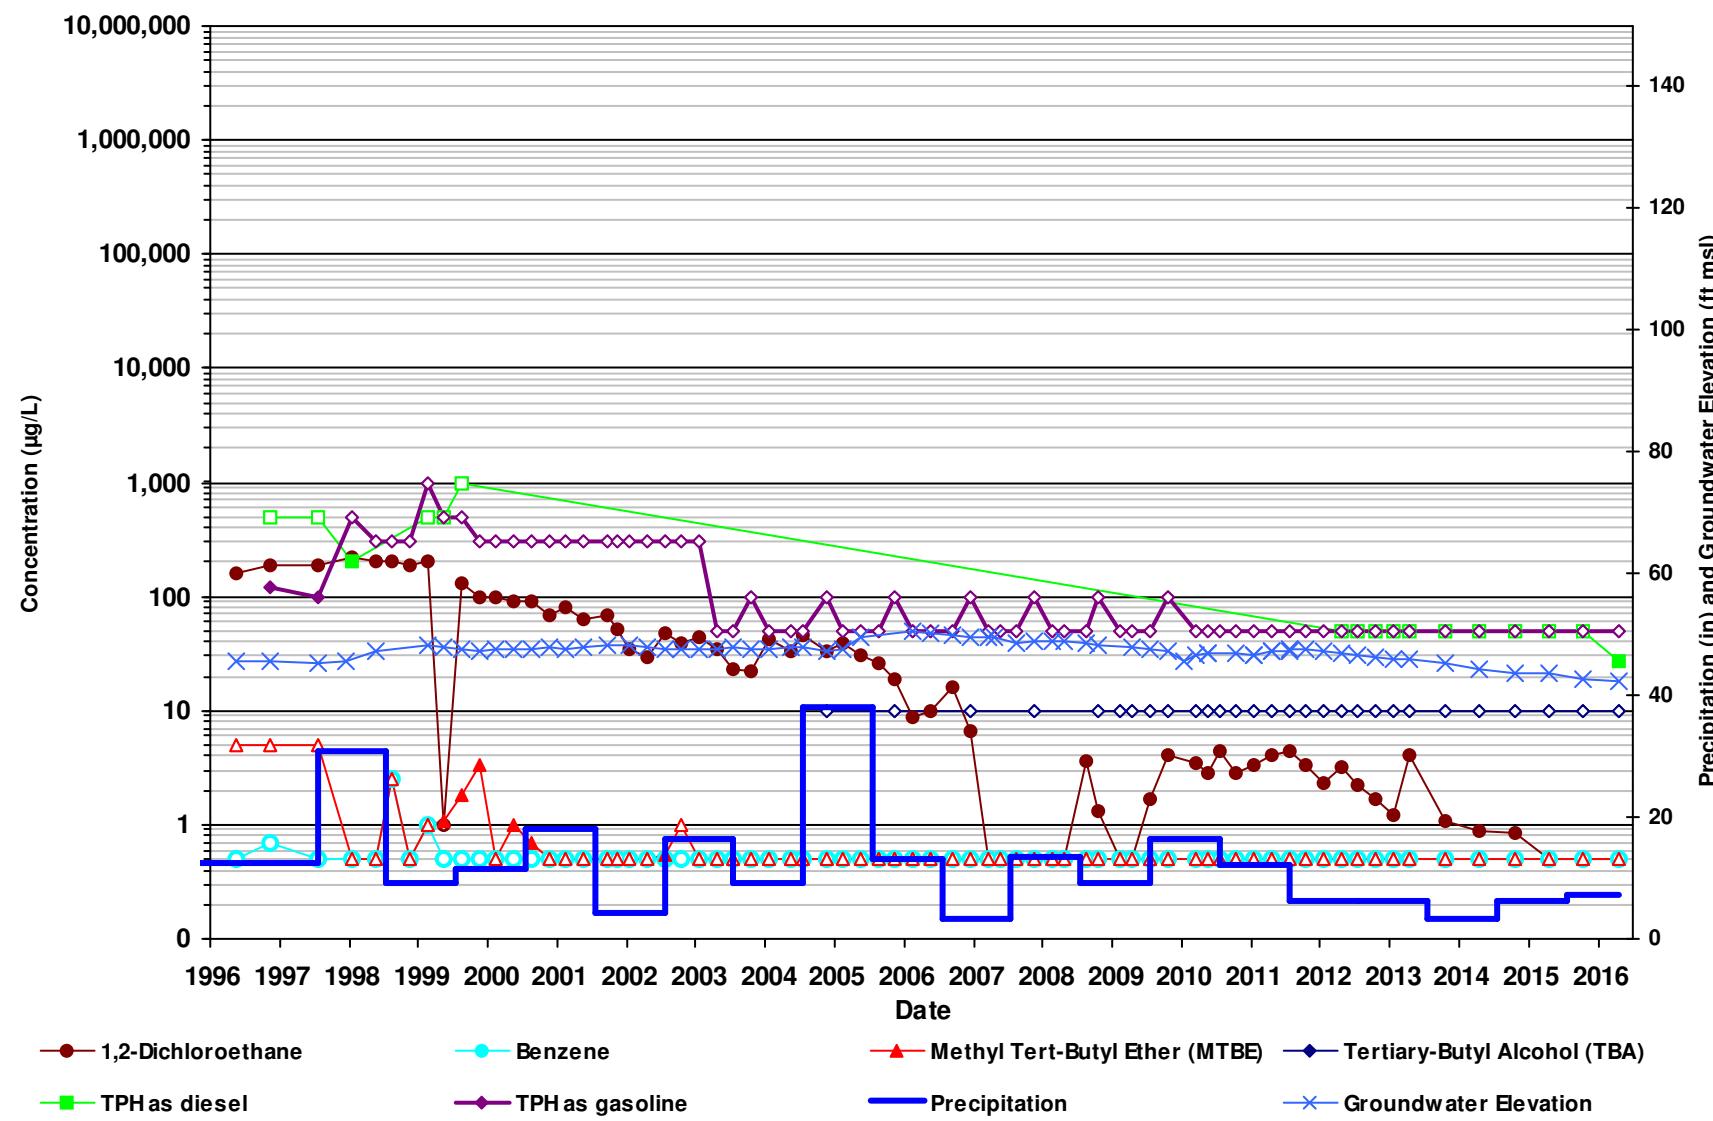

MW-22 (MID)

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

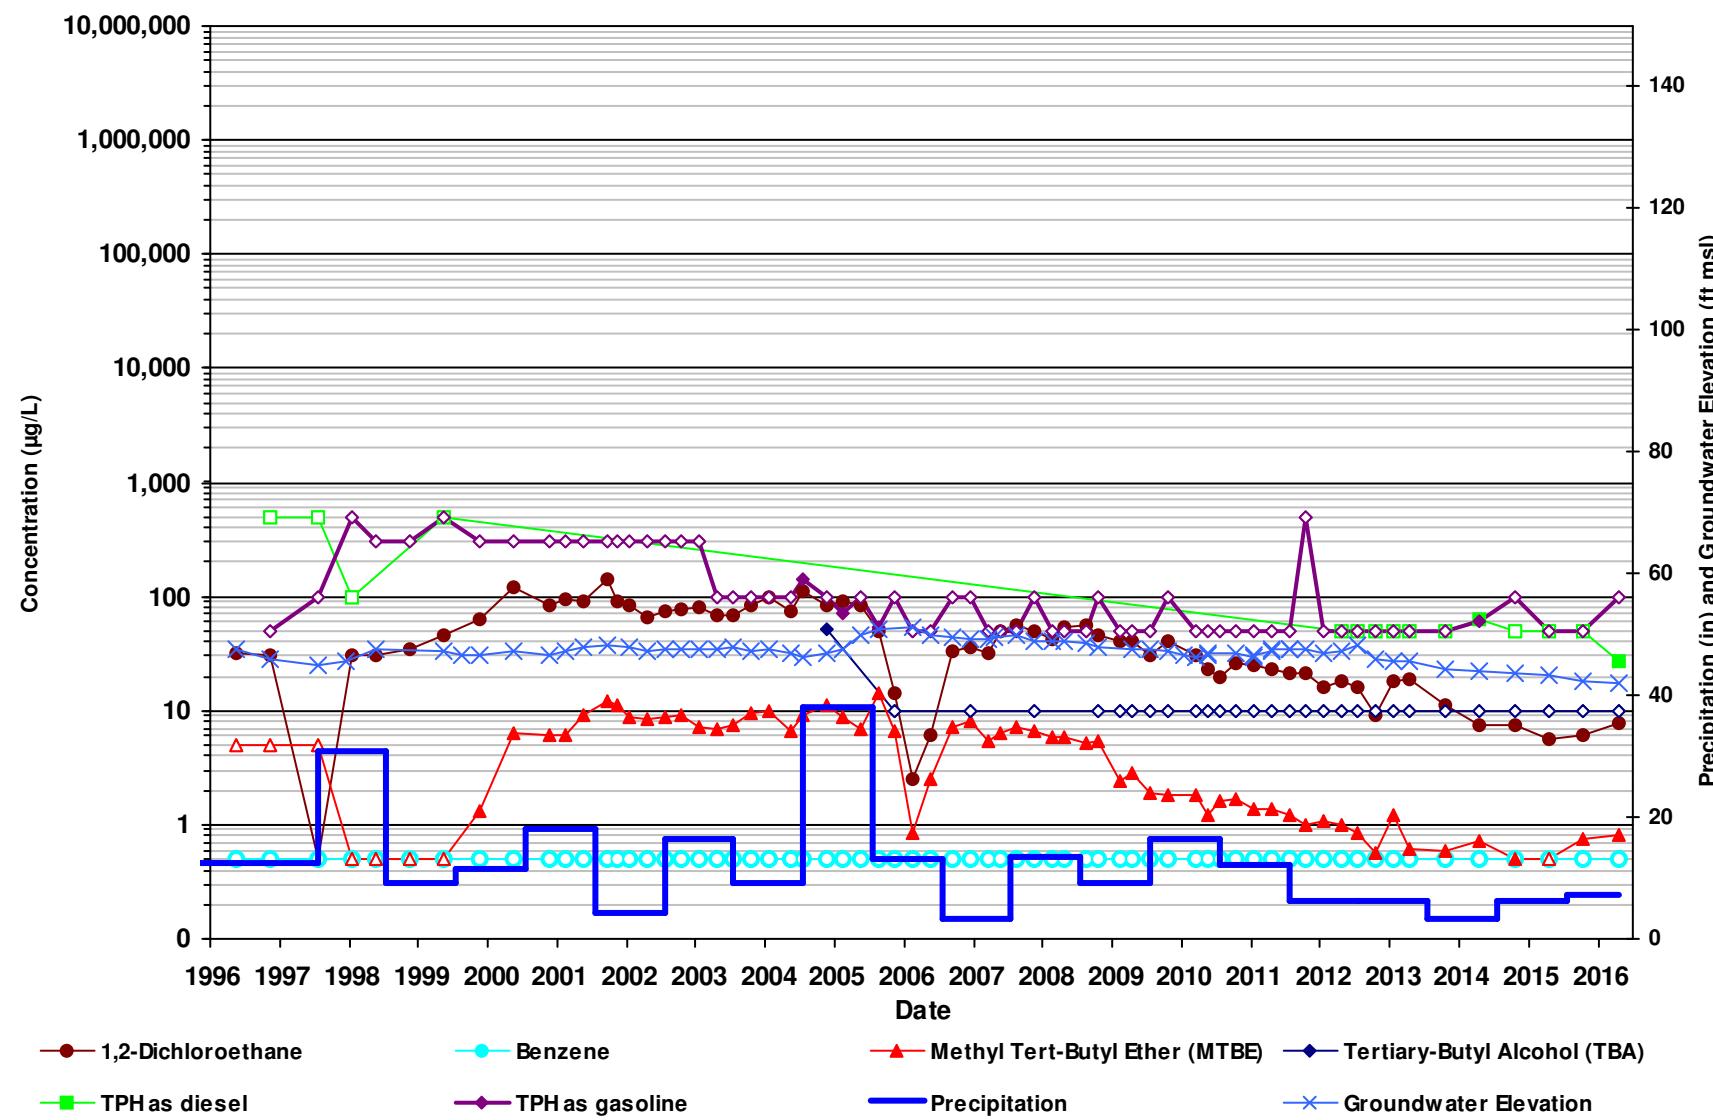

WCW-3

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

WCW-7

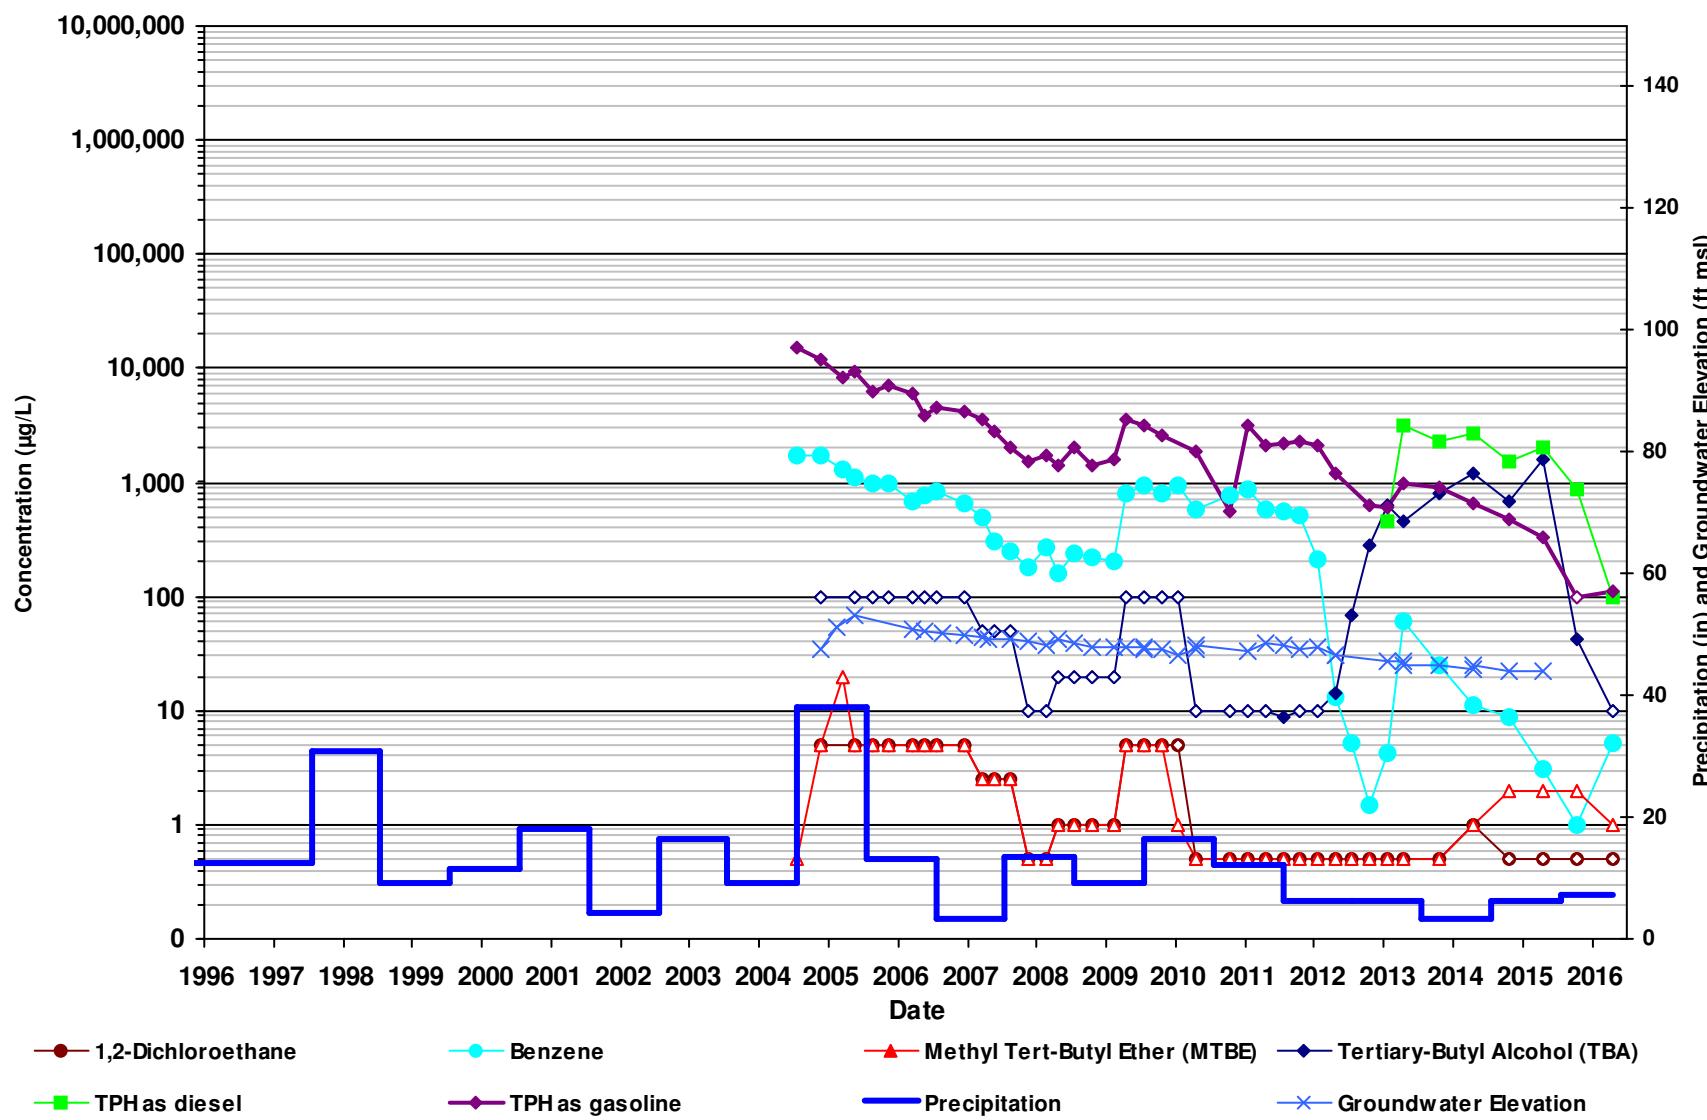

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

Northeast Onsite/Holifield Park Areas GMW-60, GMW-61, GMW-62

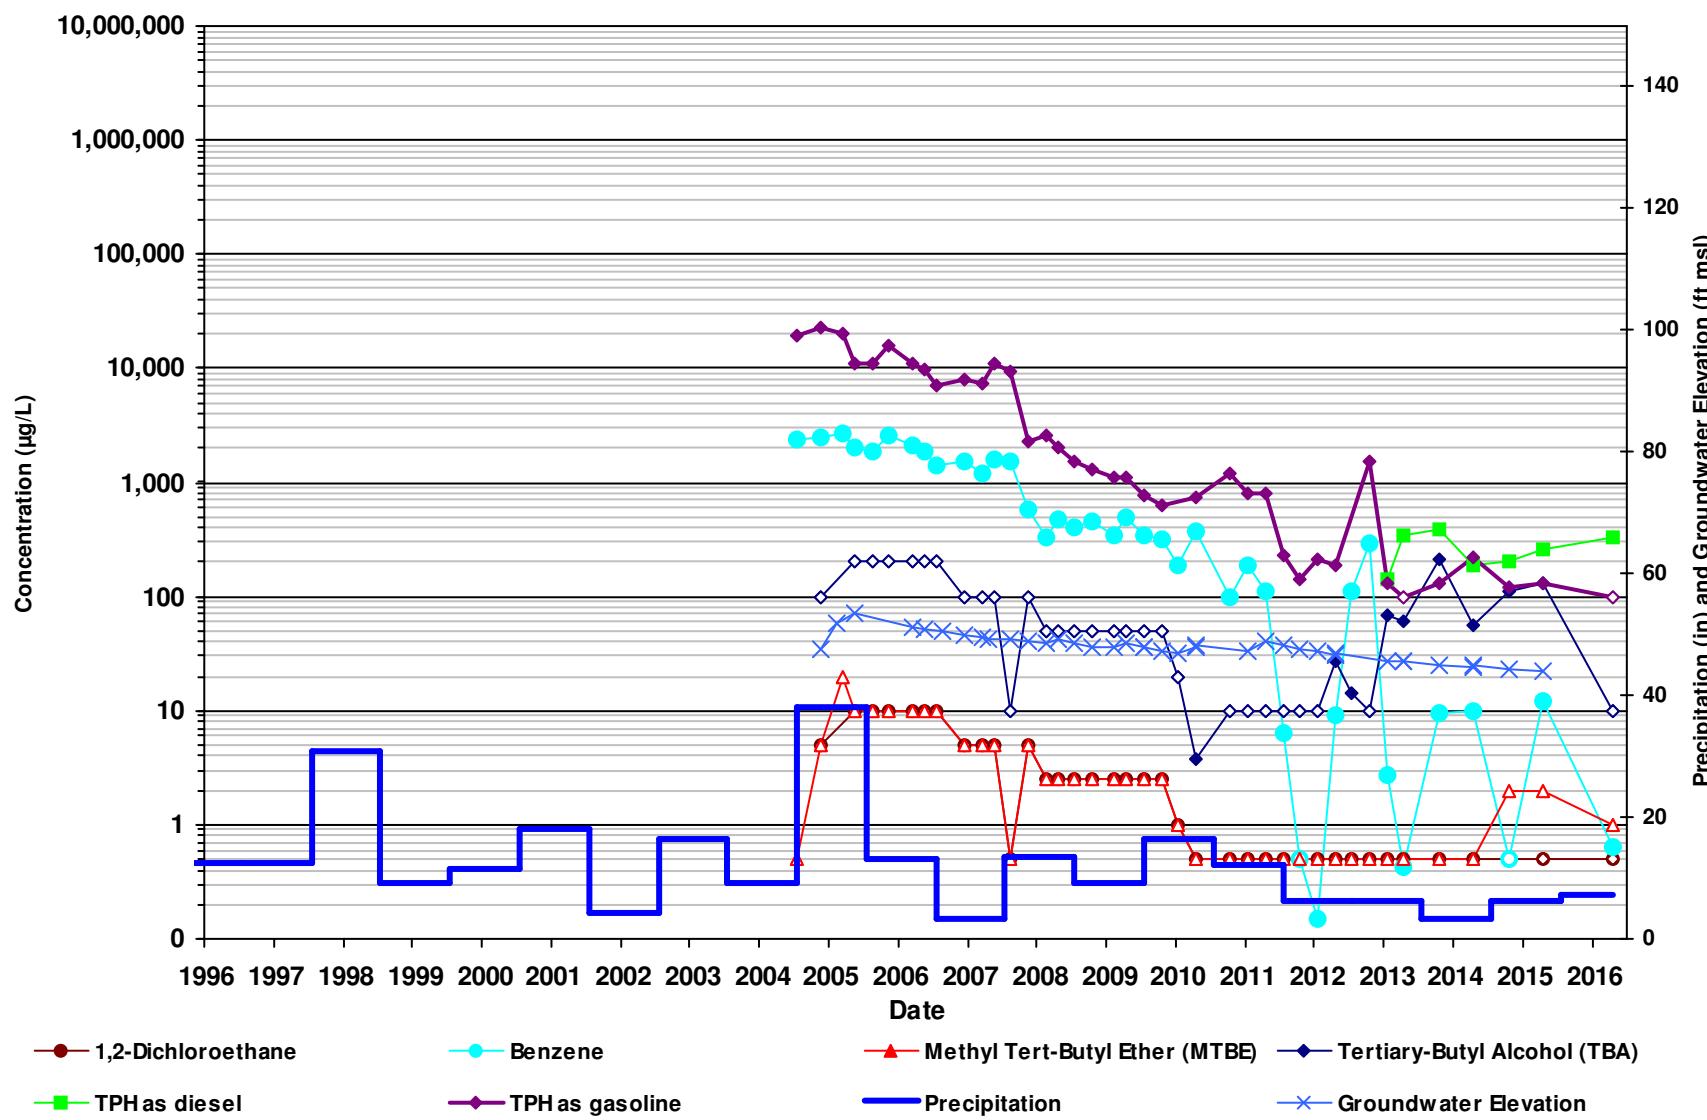

GMW-60

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

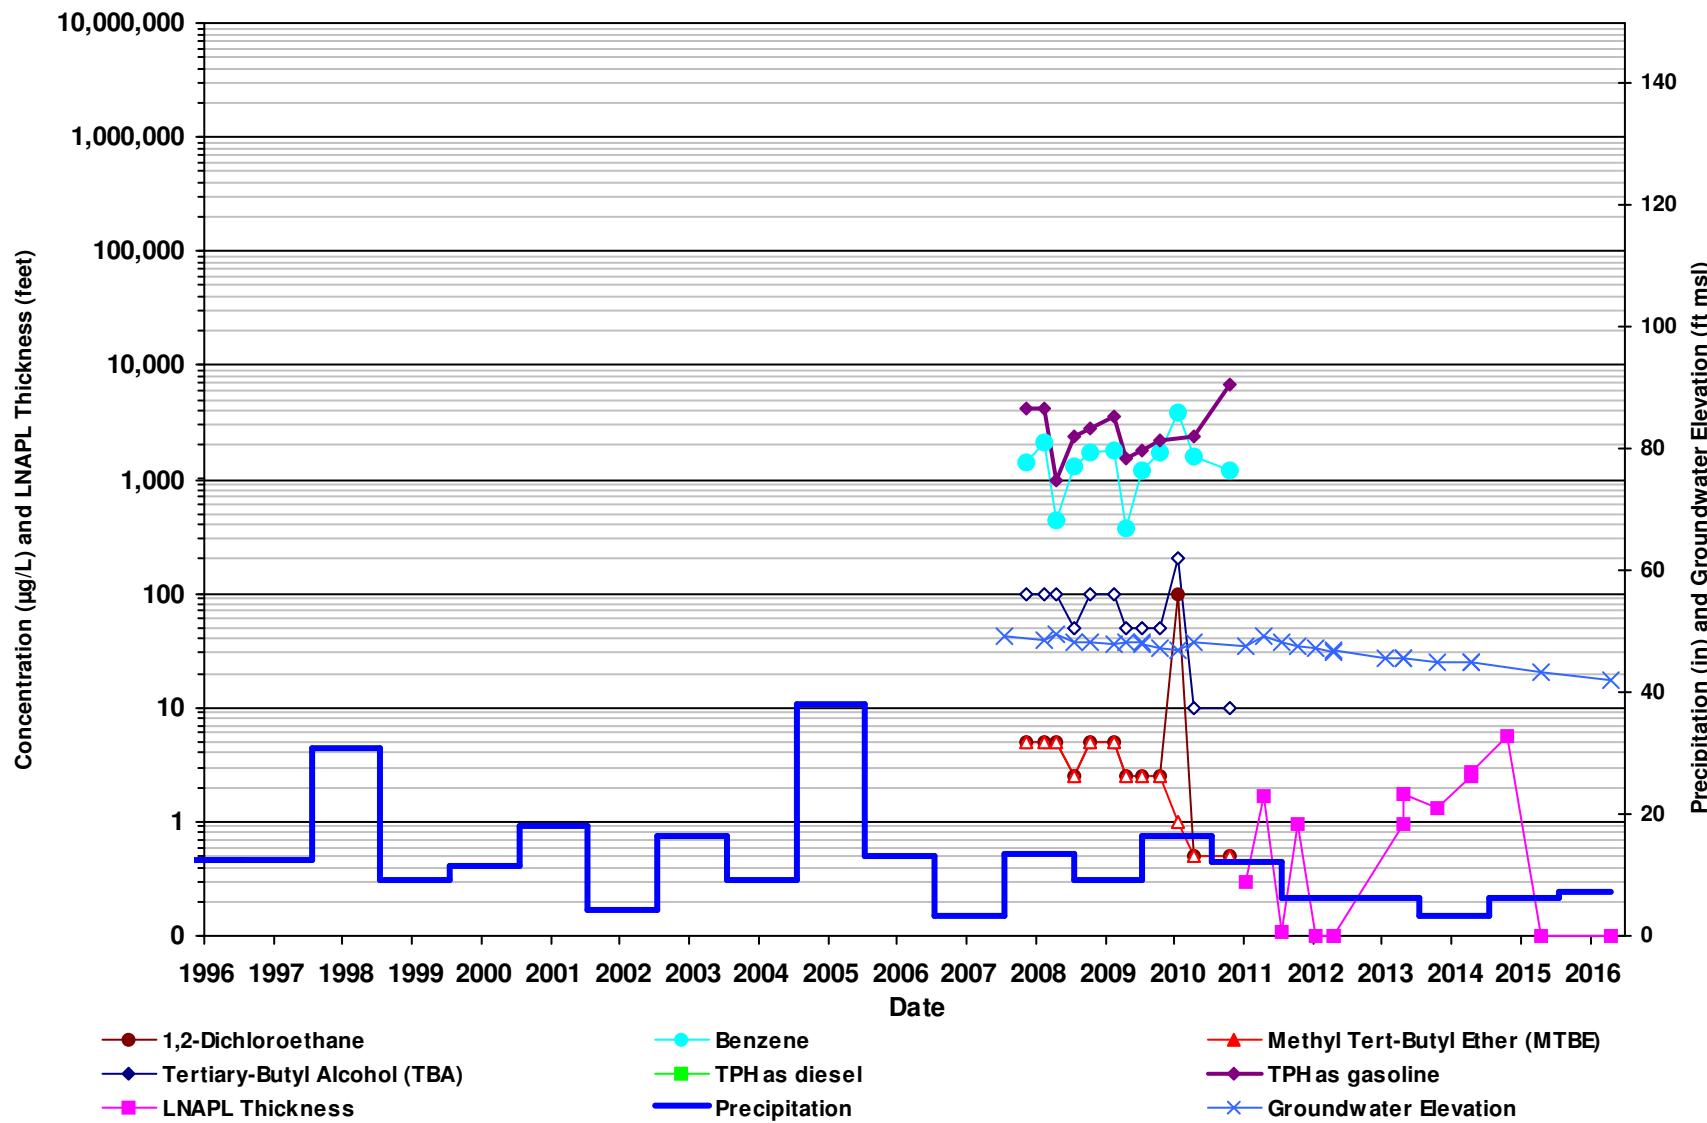

GMW-61

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

GMW-62

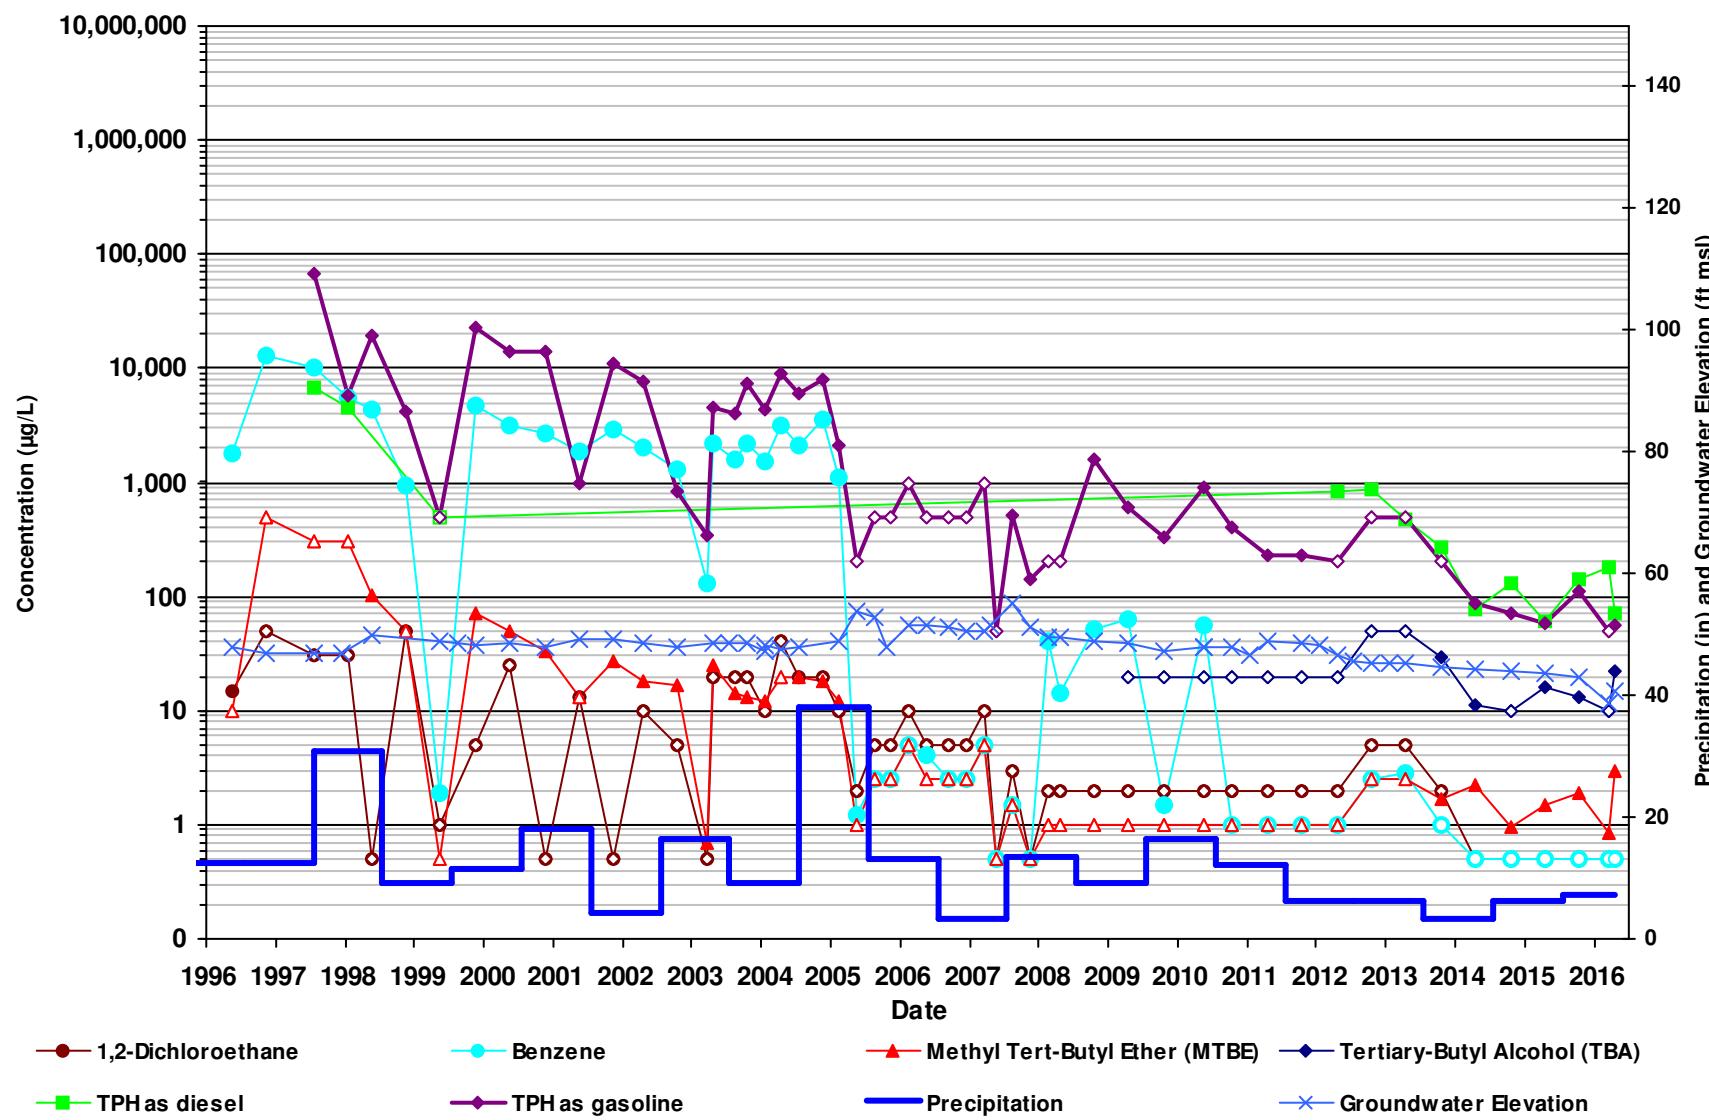

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

Former Truck Fueling Area
GMW-1, GMW-3, GMW-4,
GMW-10, MW-15

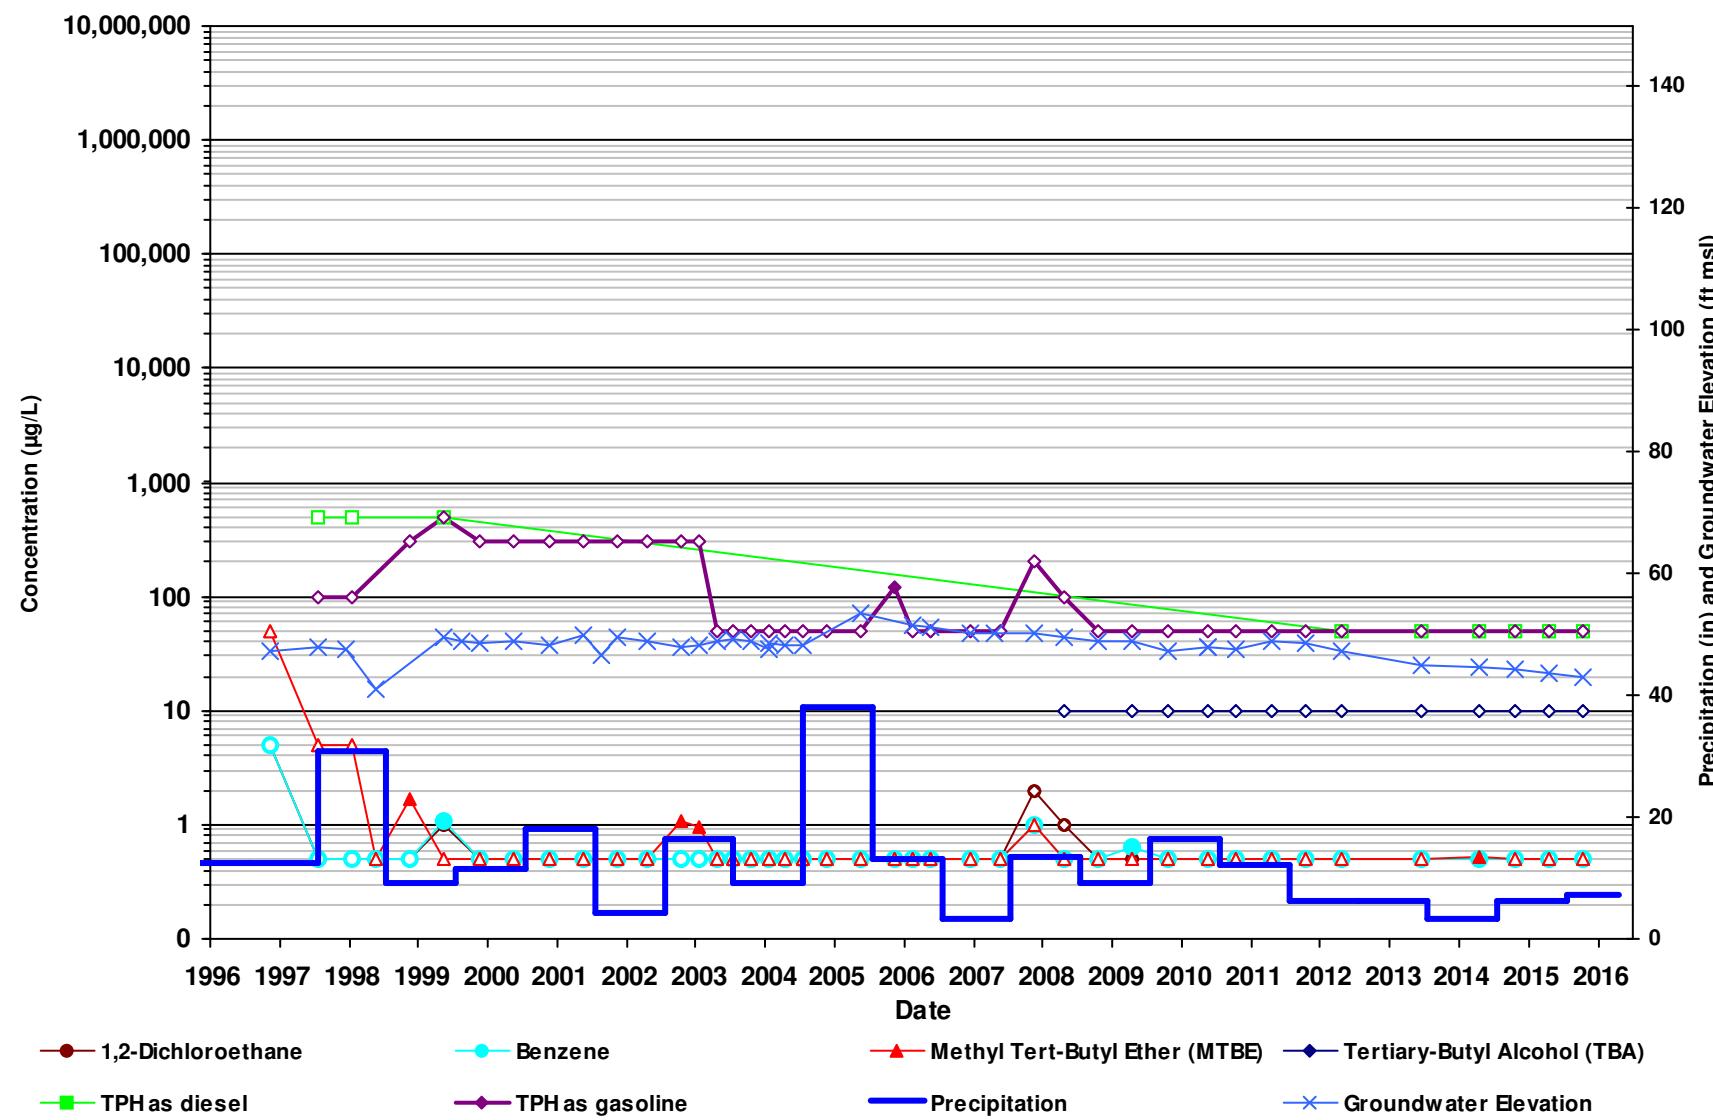

GMW-1

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

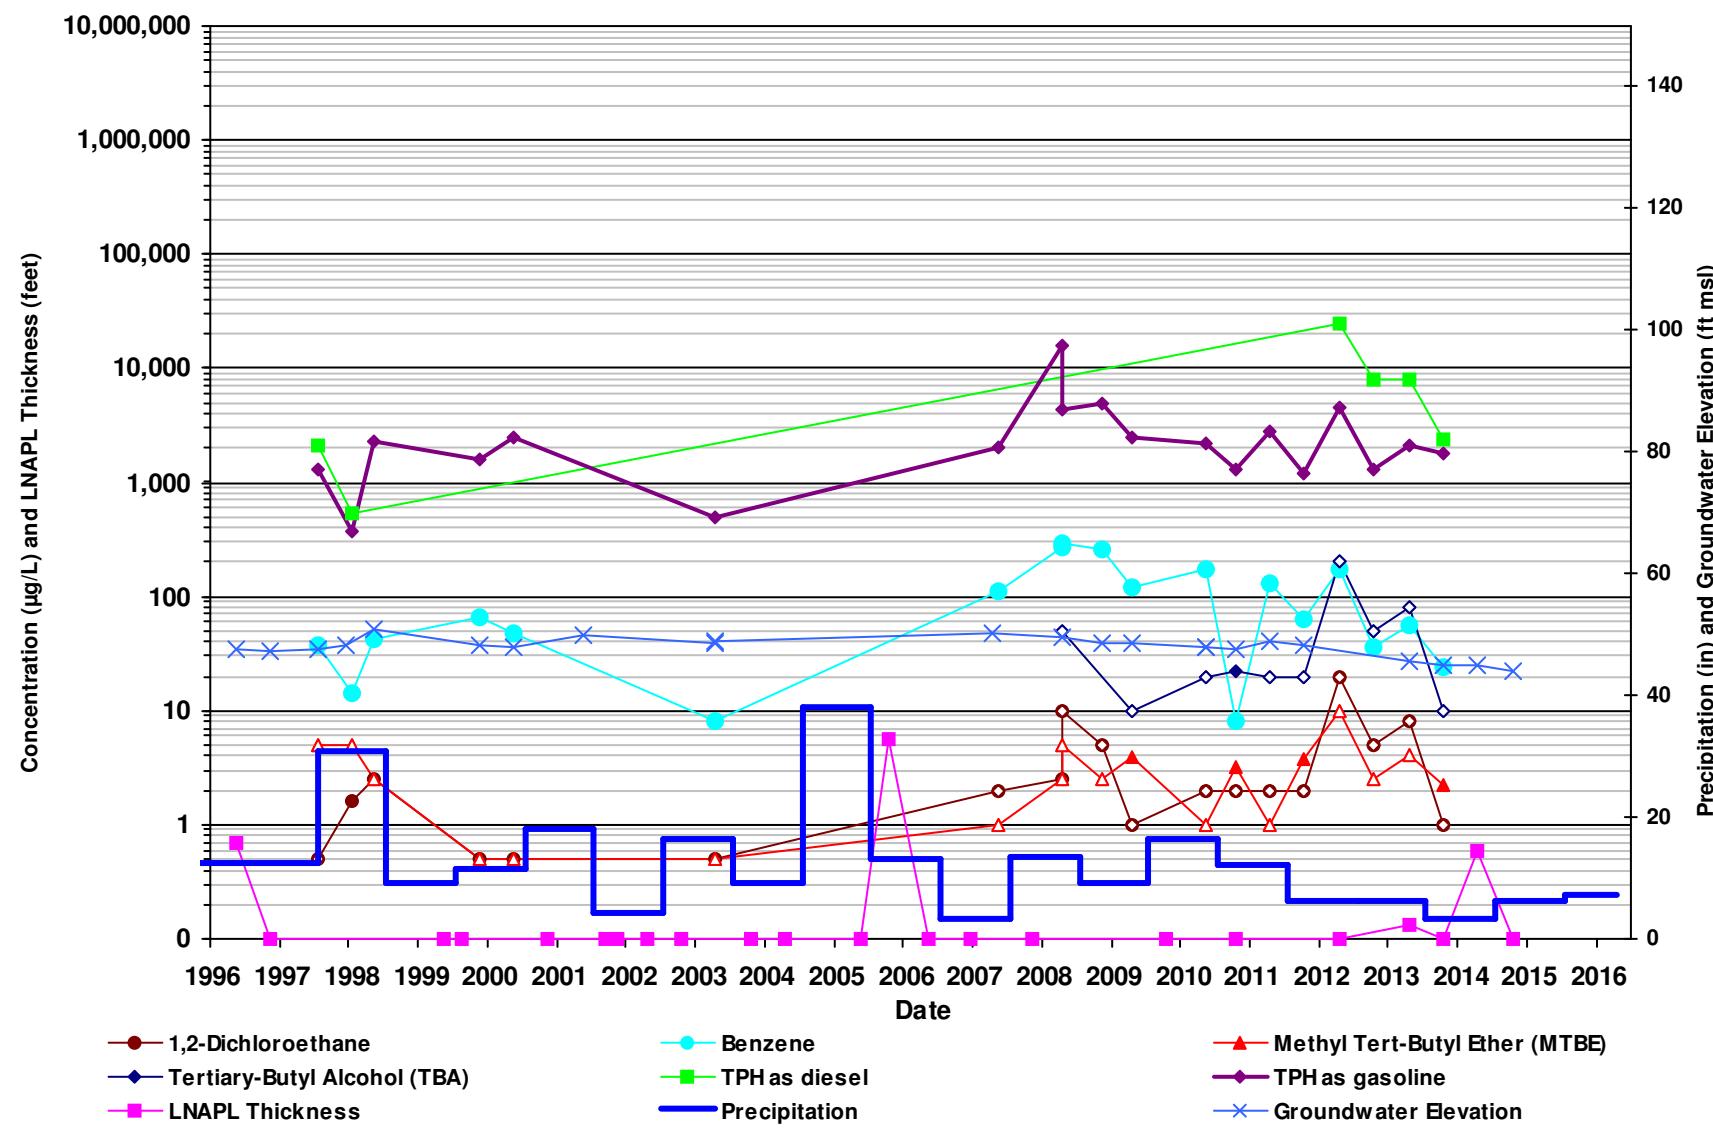

GMW-3

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

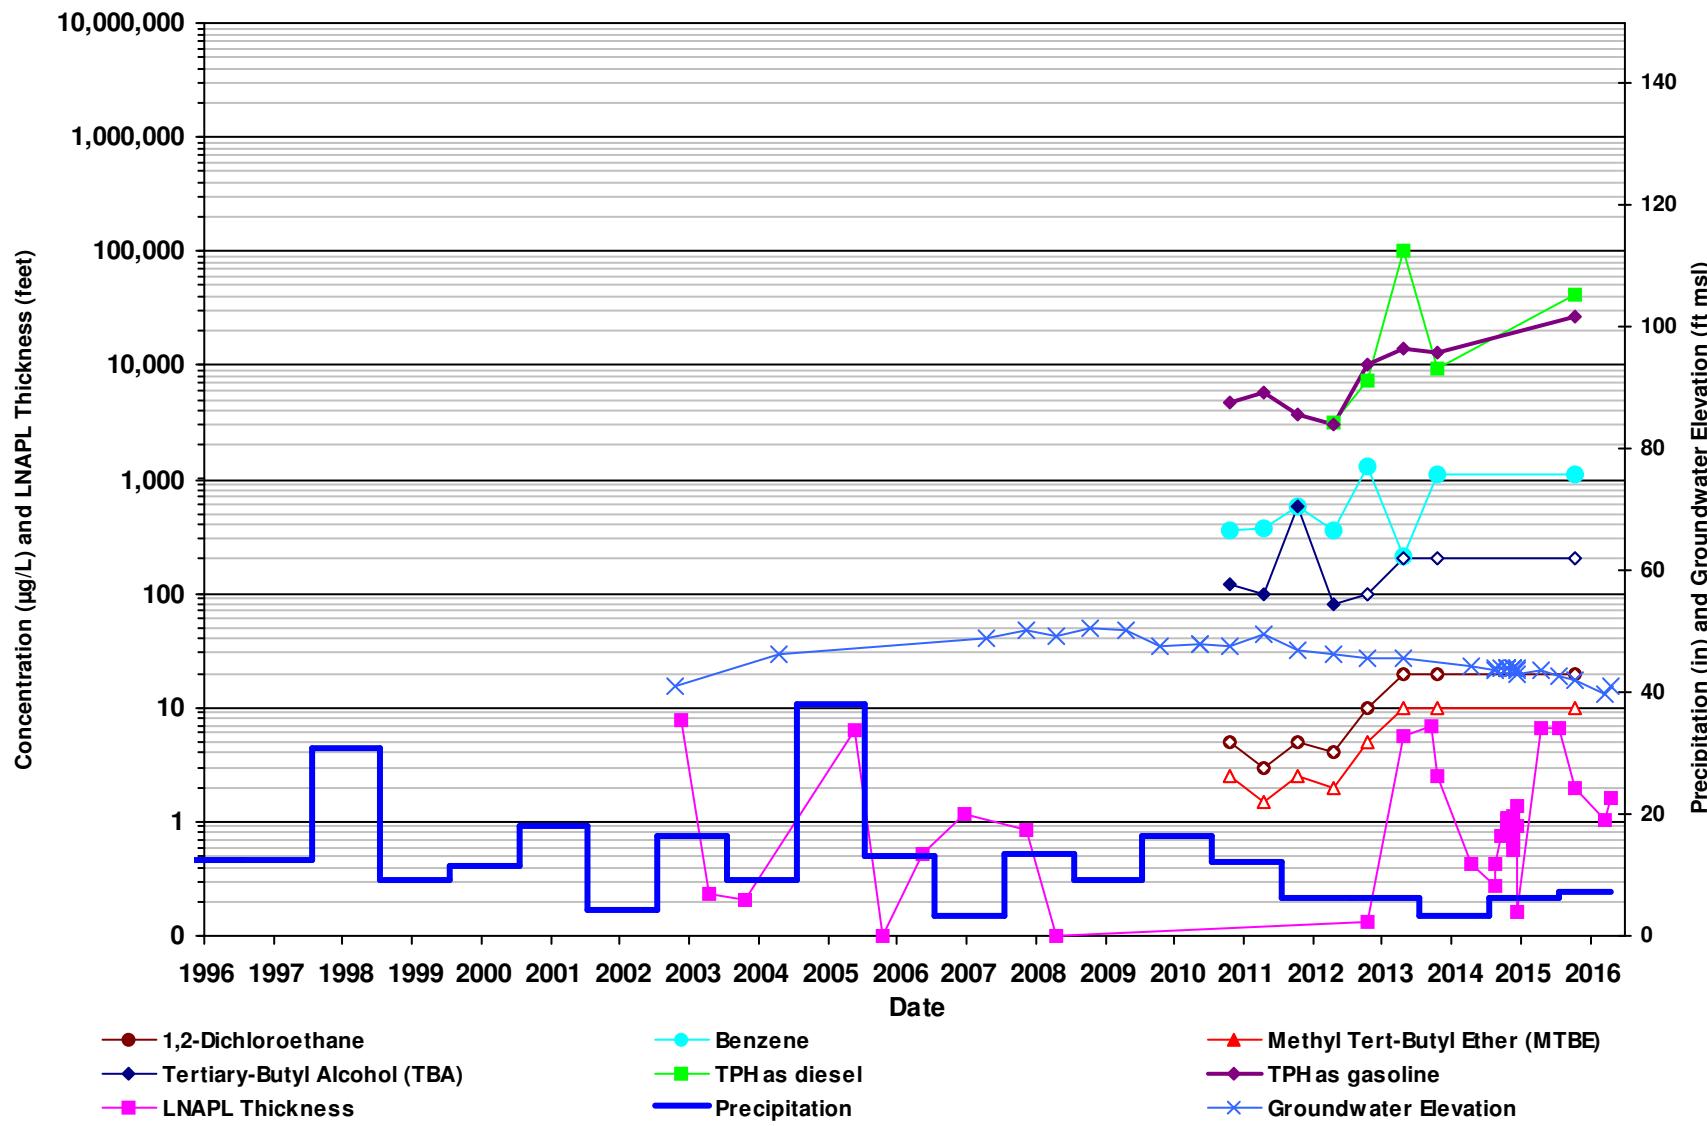

GMW-4

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

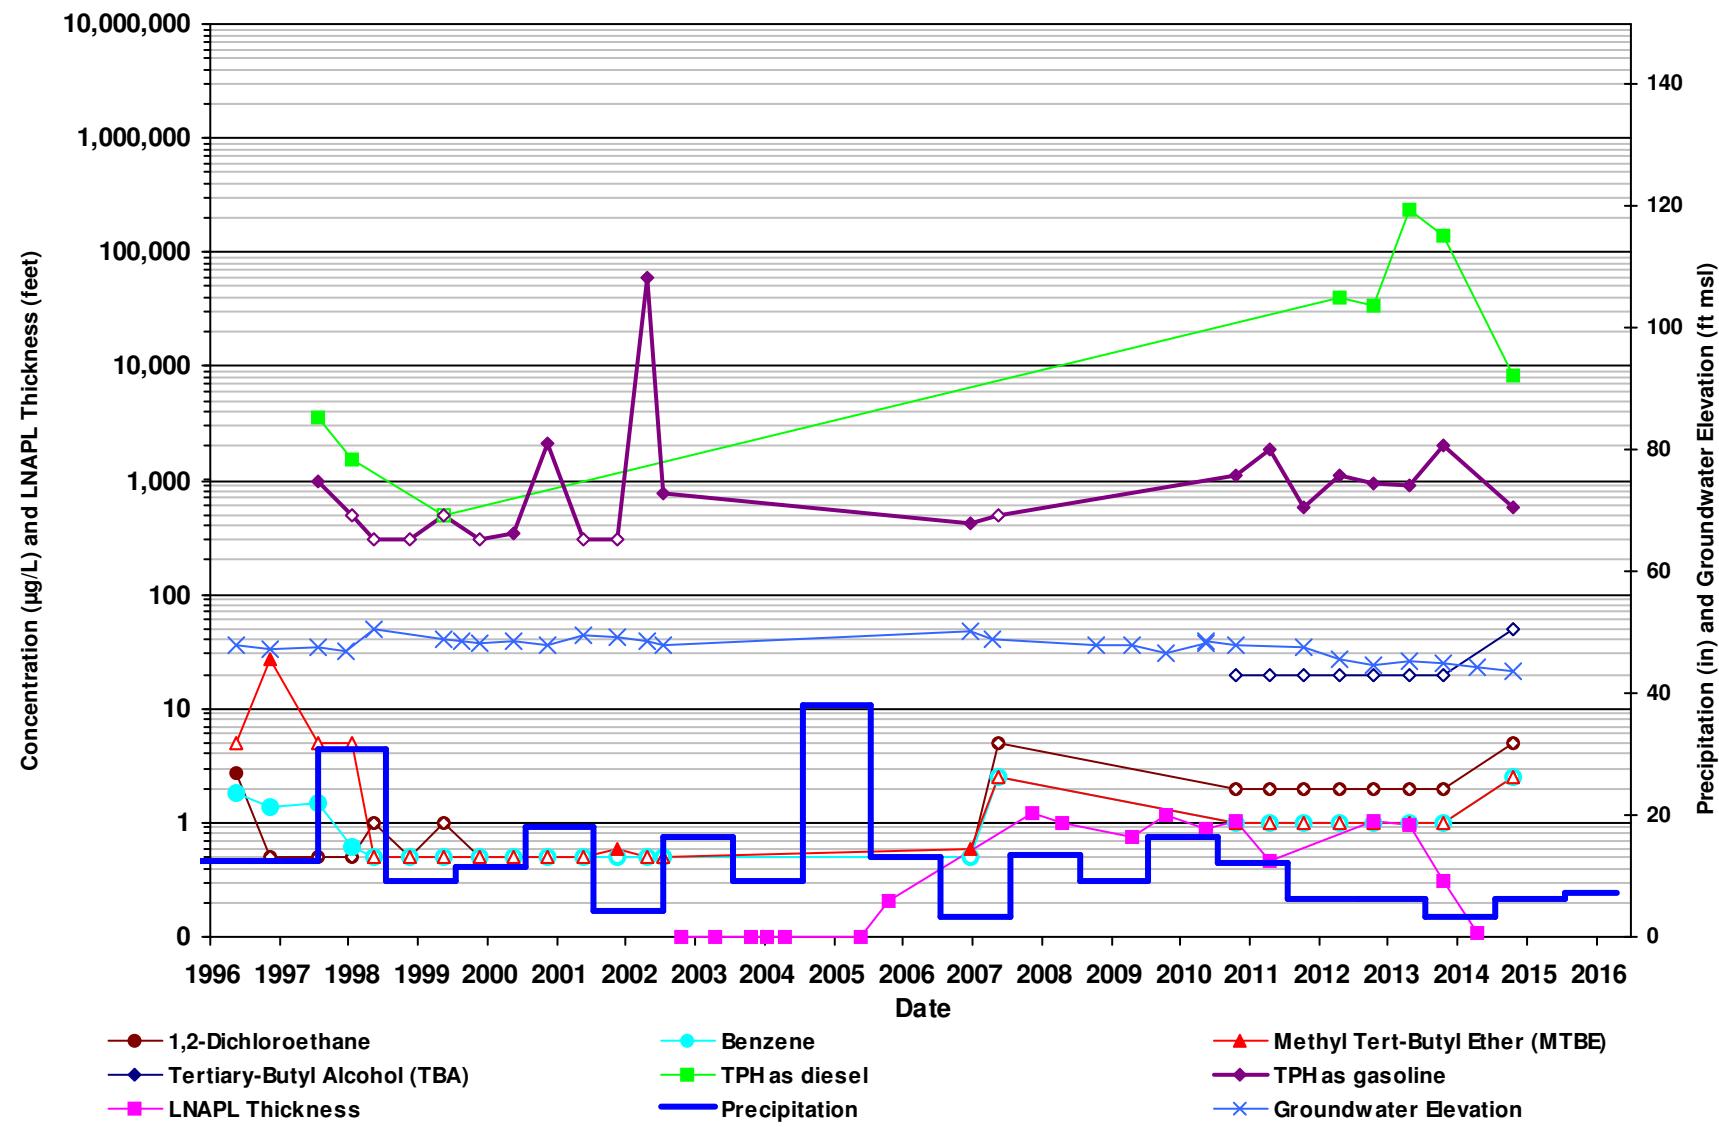

GMW-10

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

MW-15

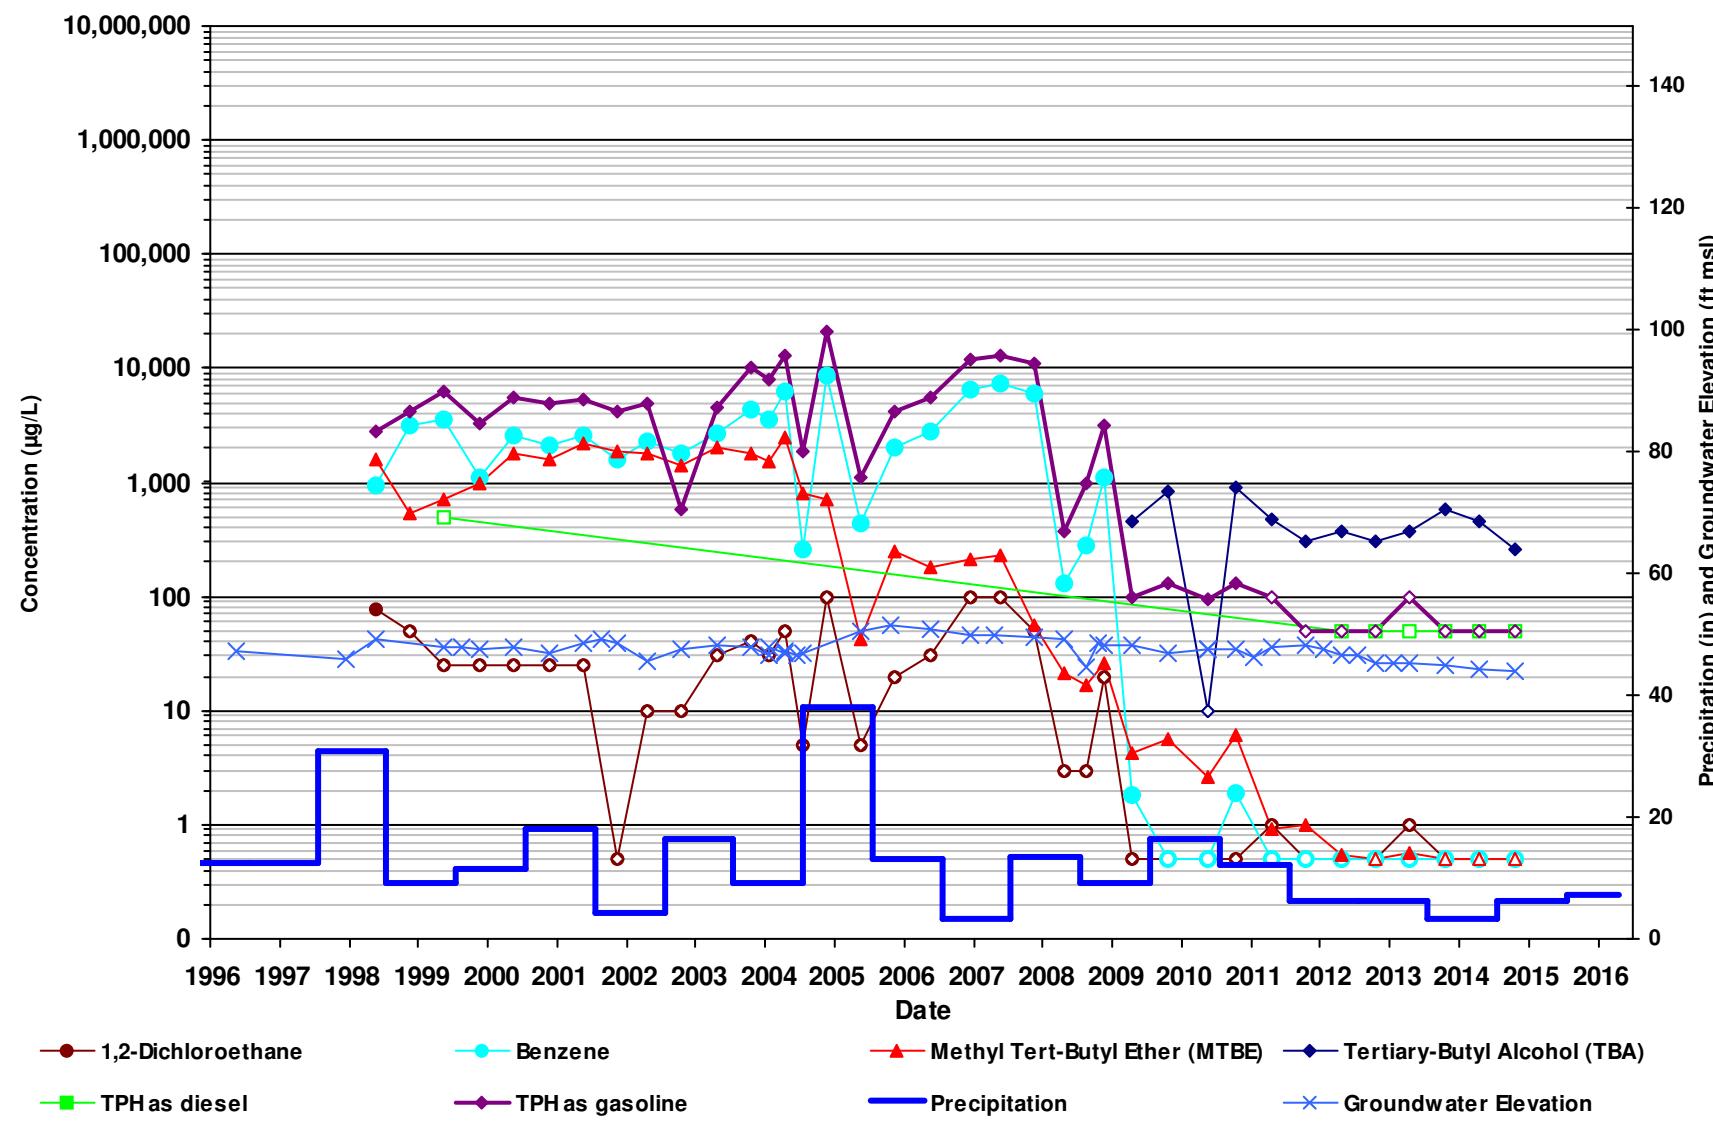

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

South-Central Area
GMW-27, GMW-O-3, GMW-O-5,
GMW-O-9, GMW-O-10, GMW-O-14,
GWR-1, HL-2, MW-SF-1, MW-SF-9

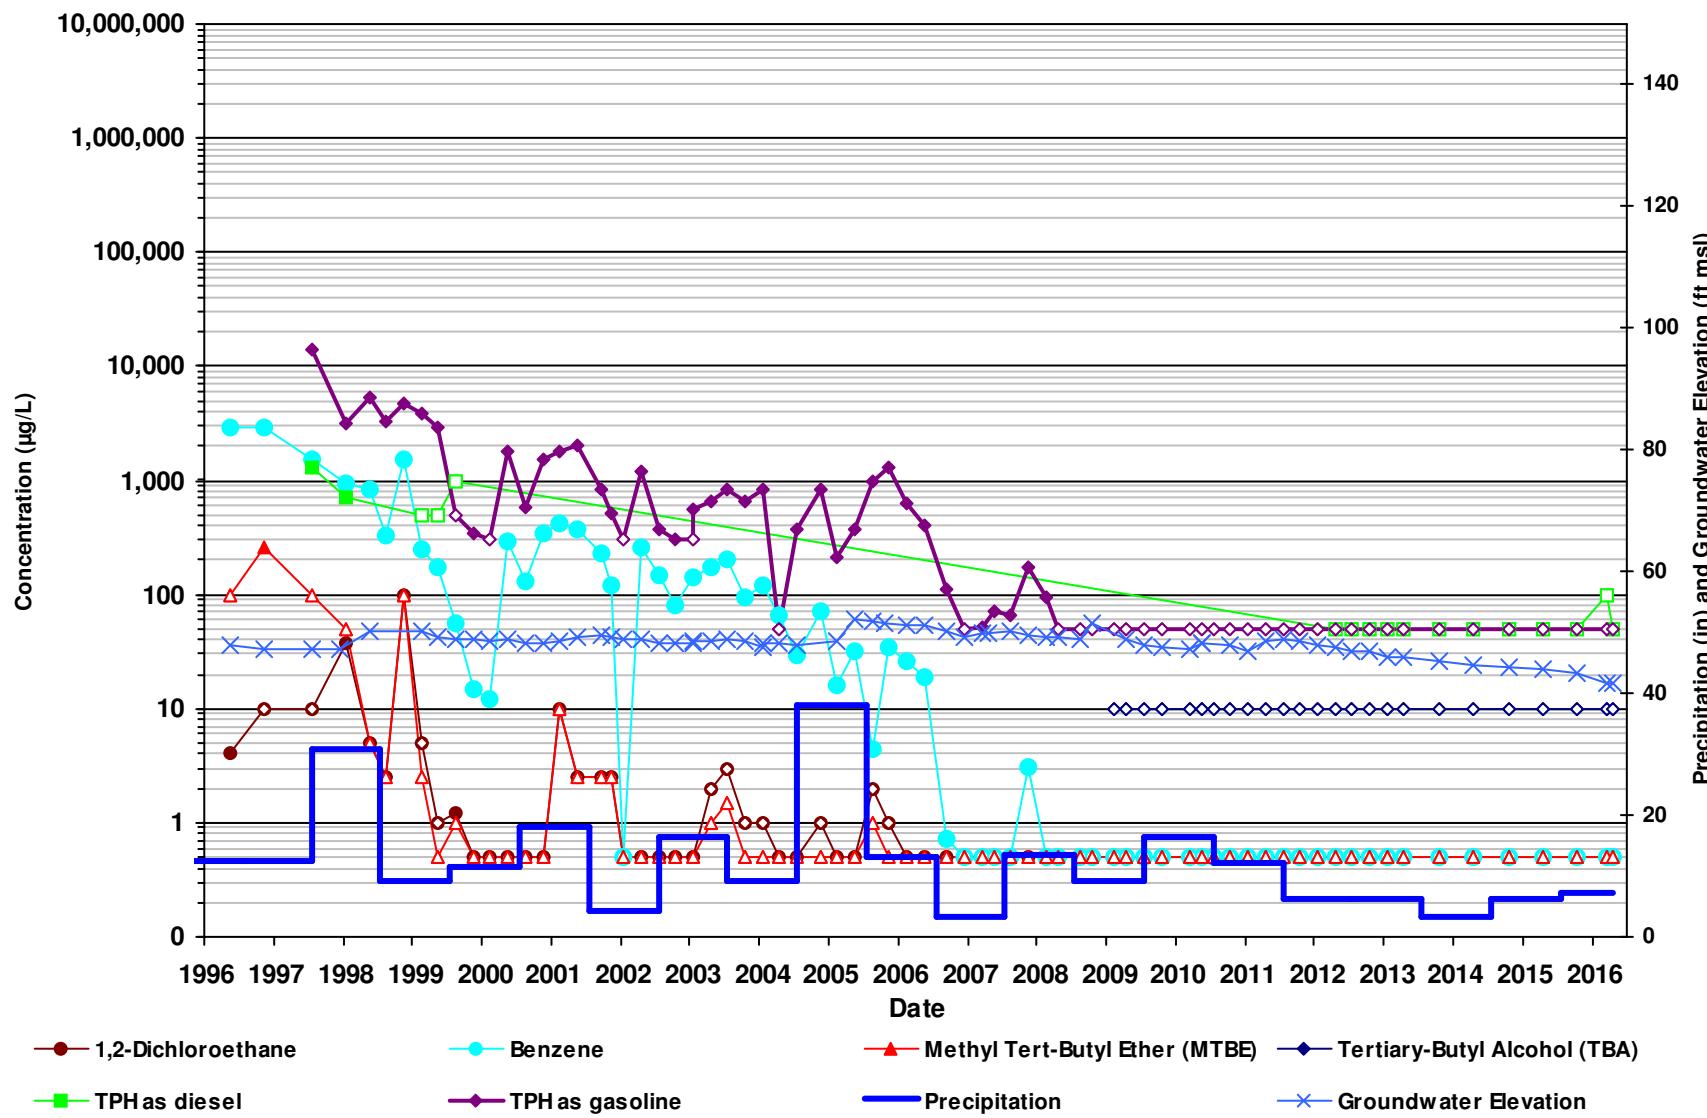

GMW-27

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

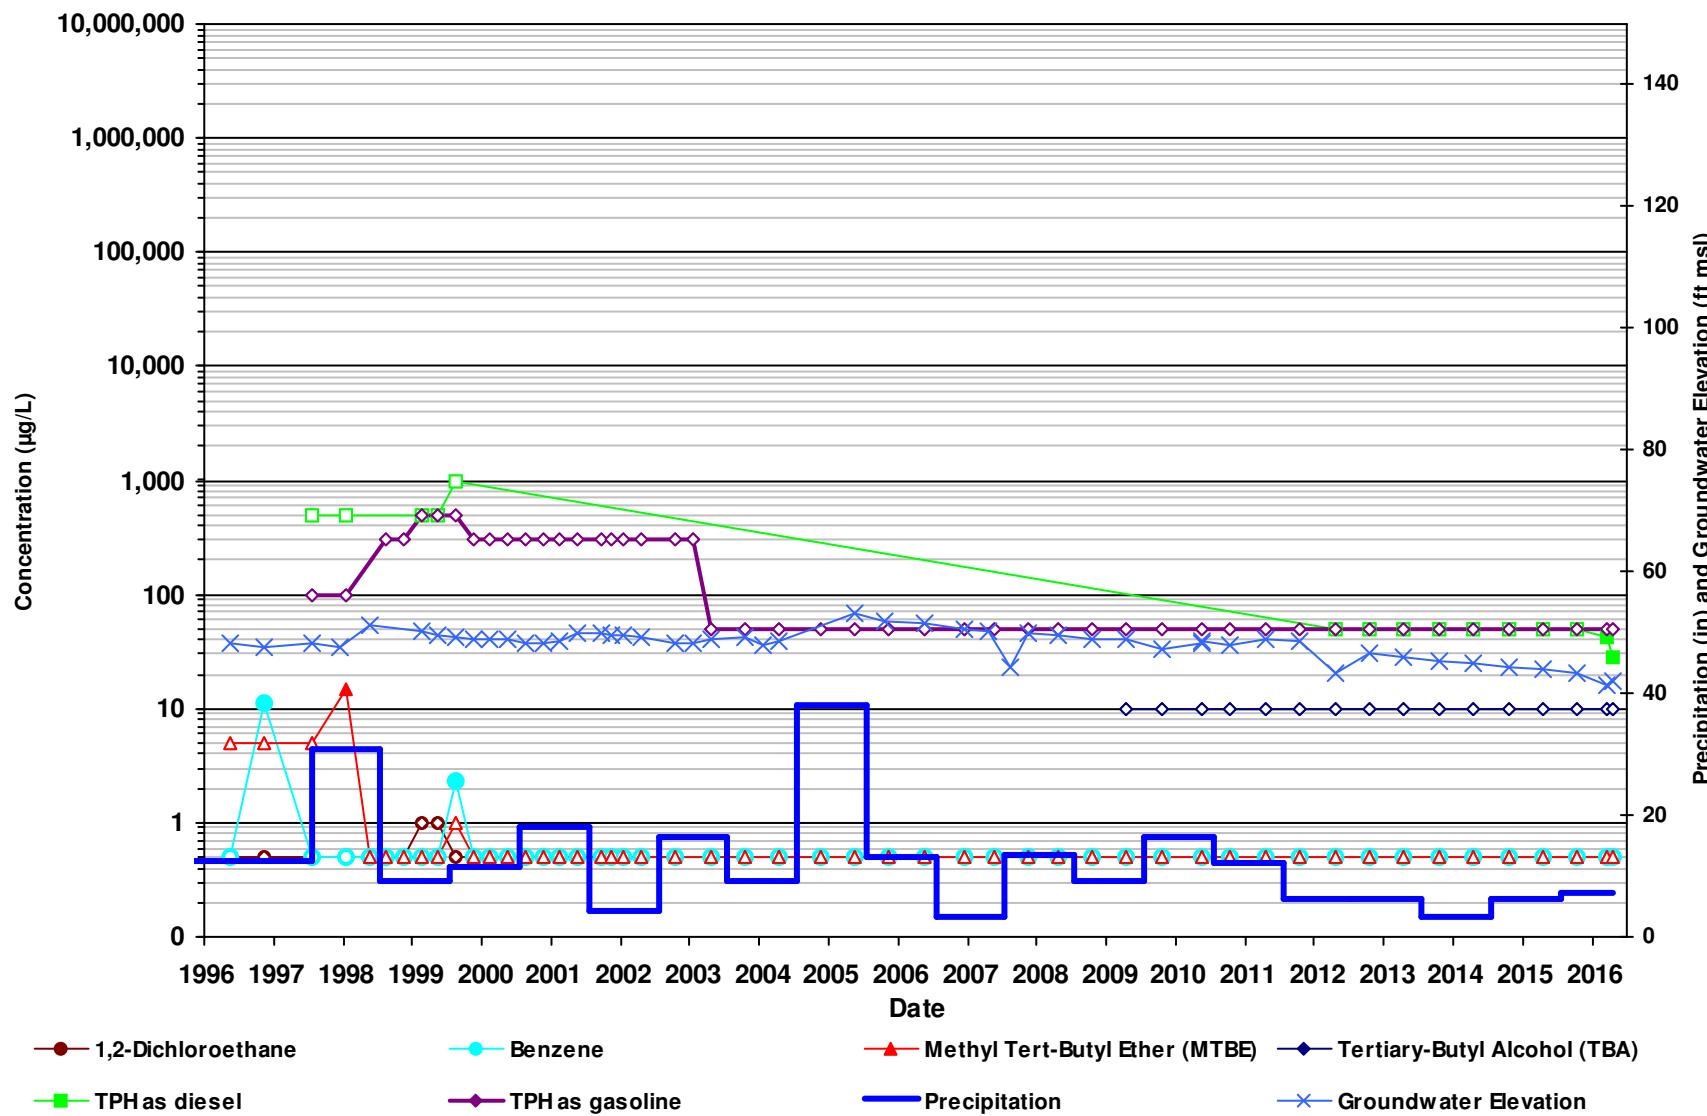

GMW-O-3

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

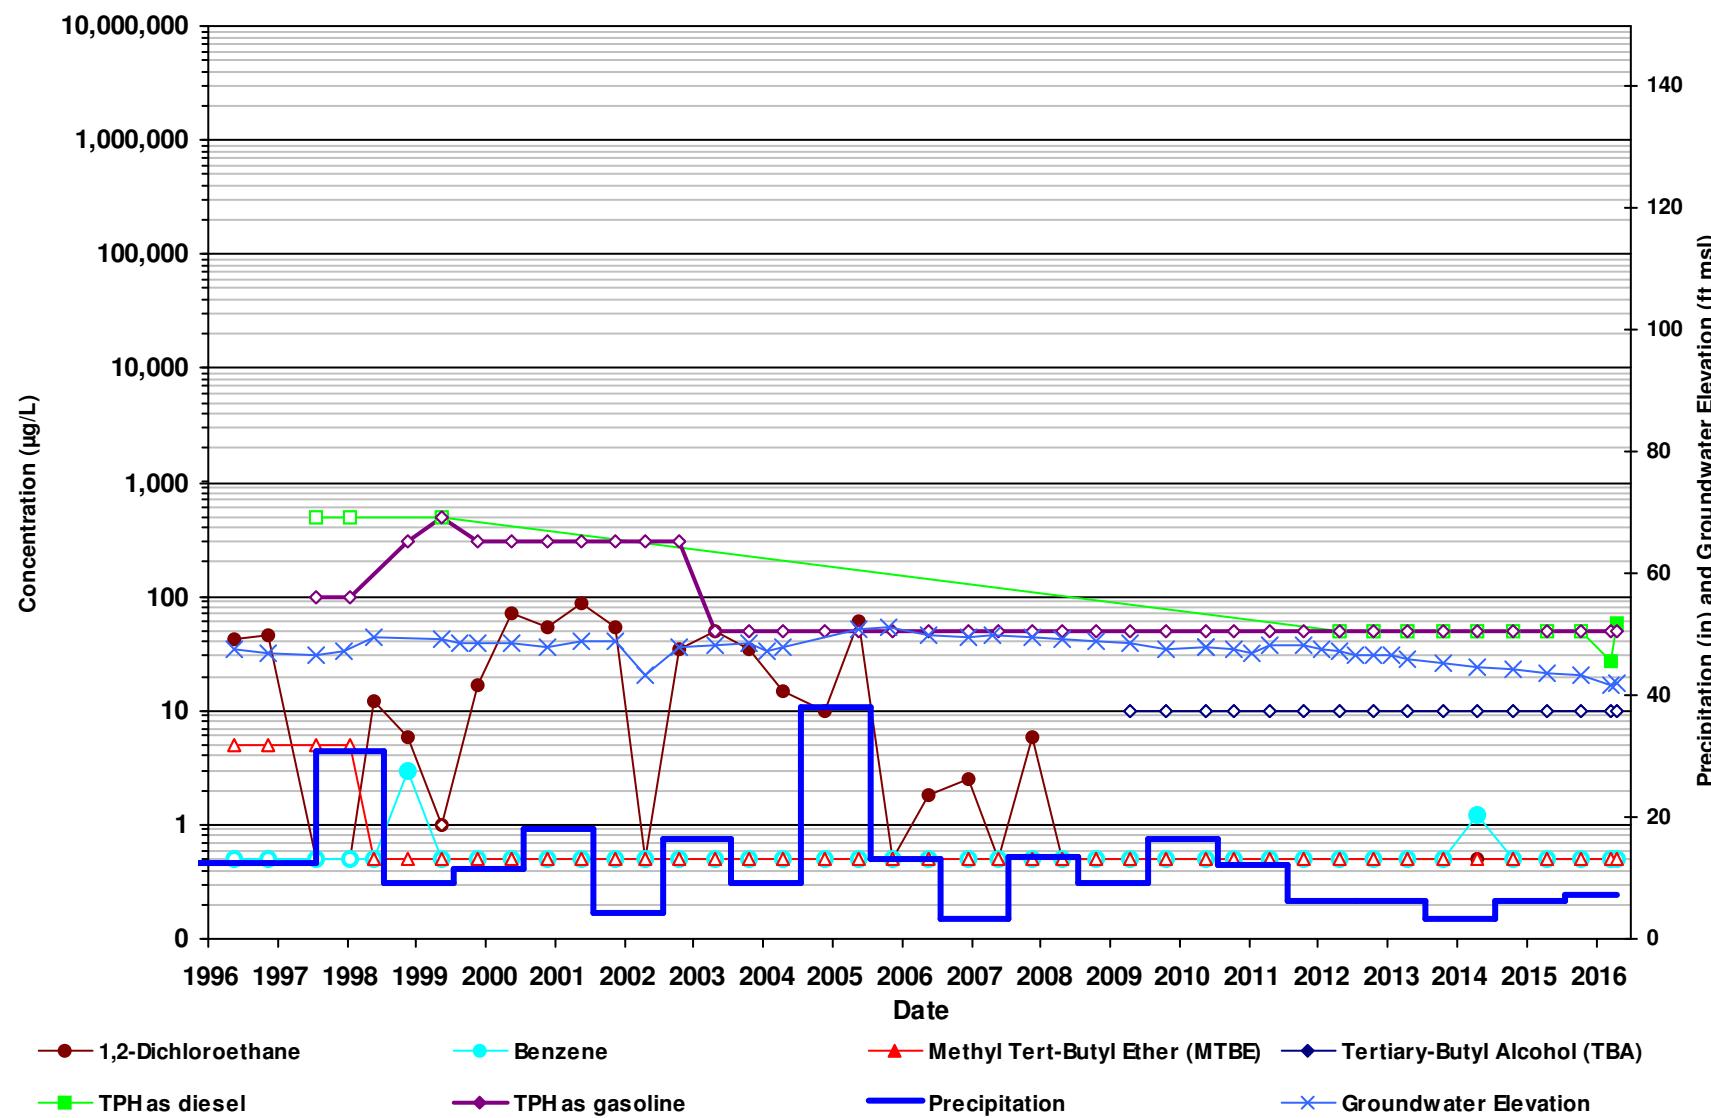

GMW-O-5

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

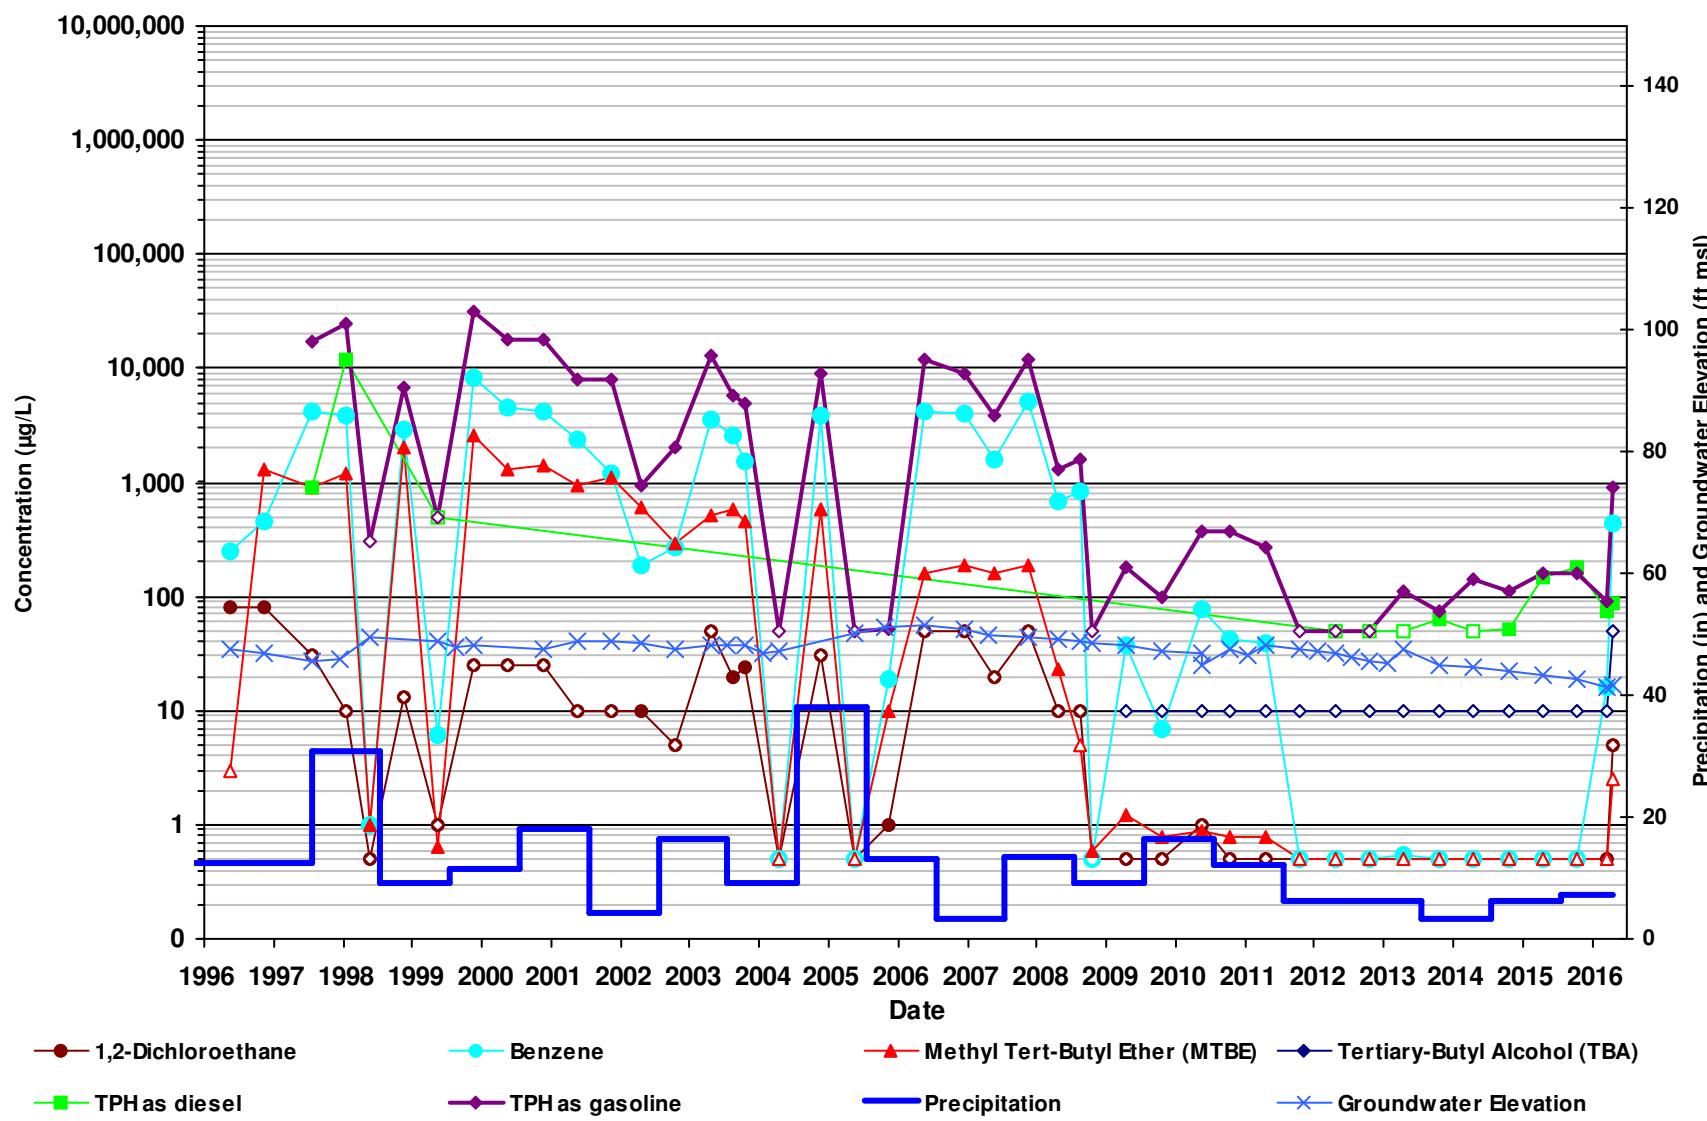

GMW-O-9

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

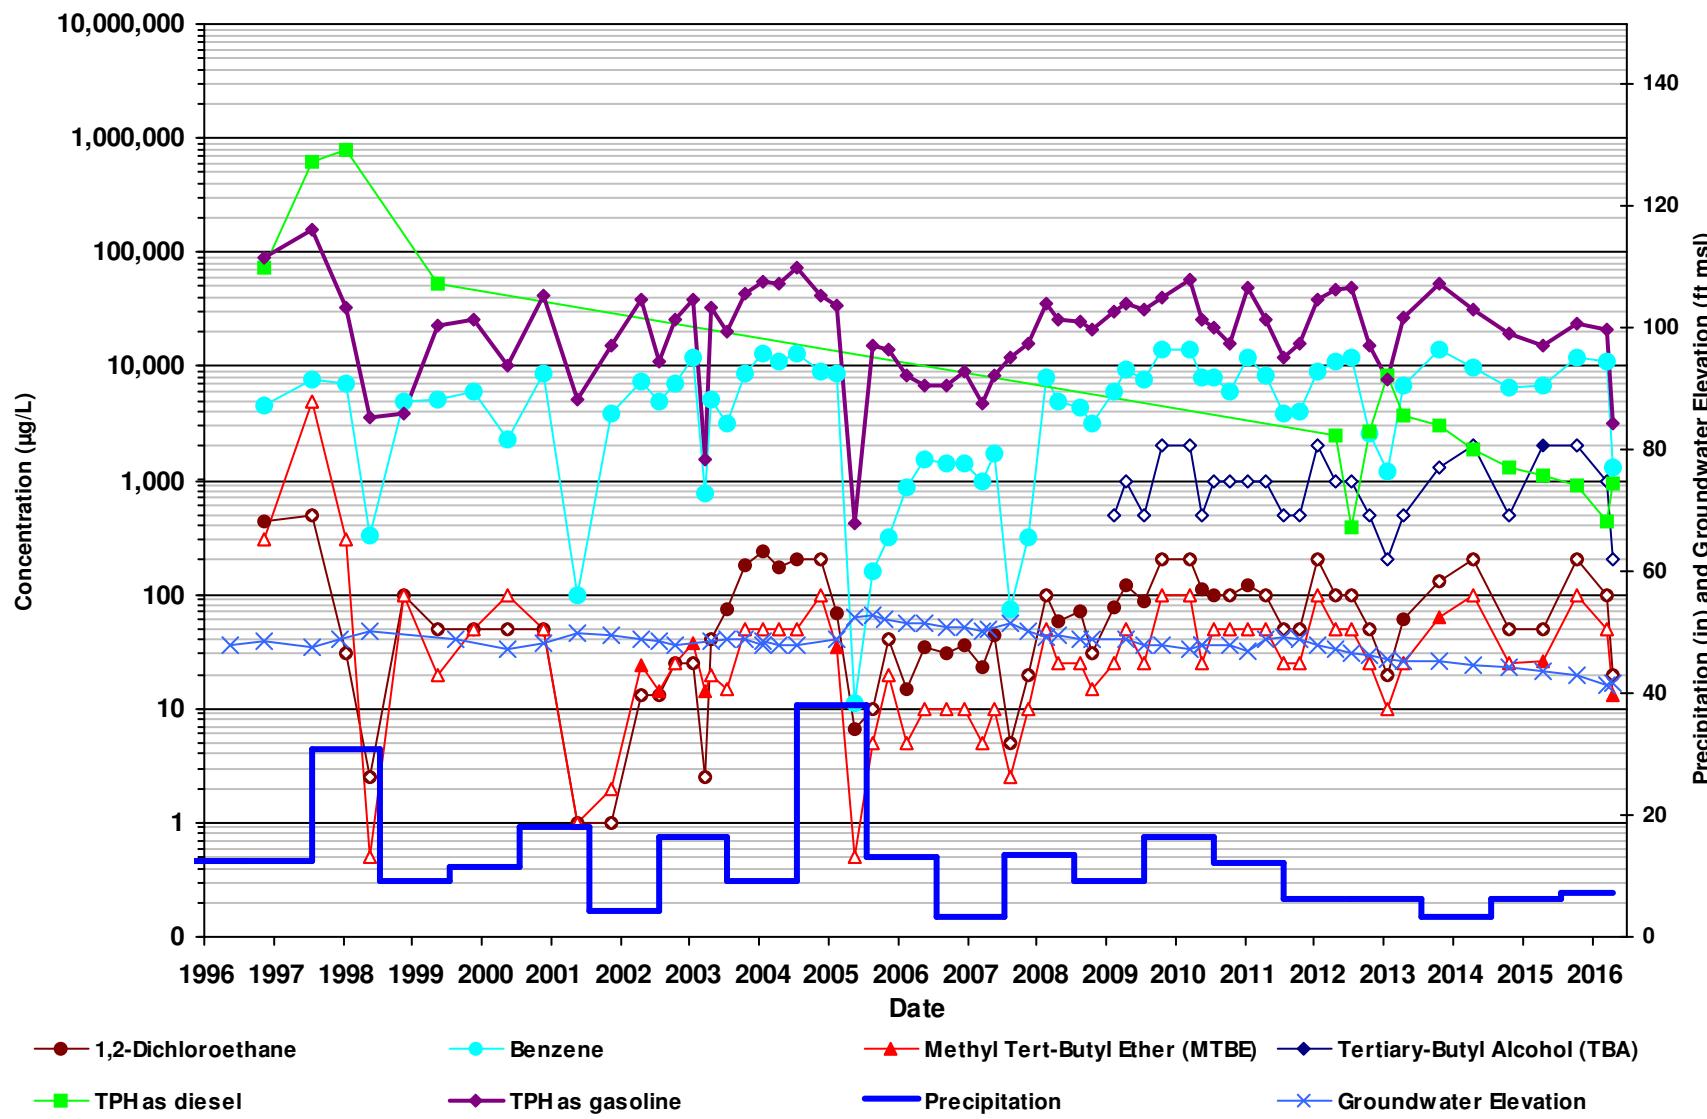

GMW-O-10

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

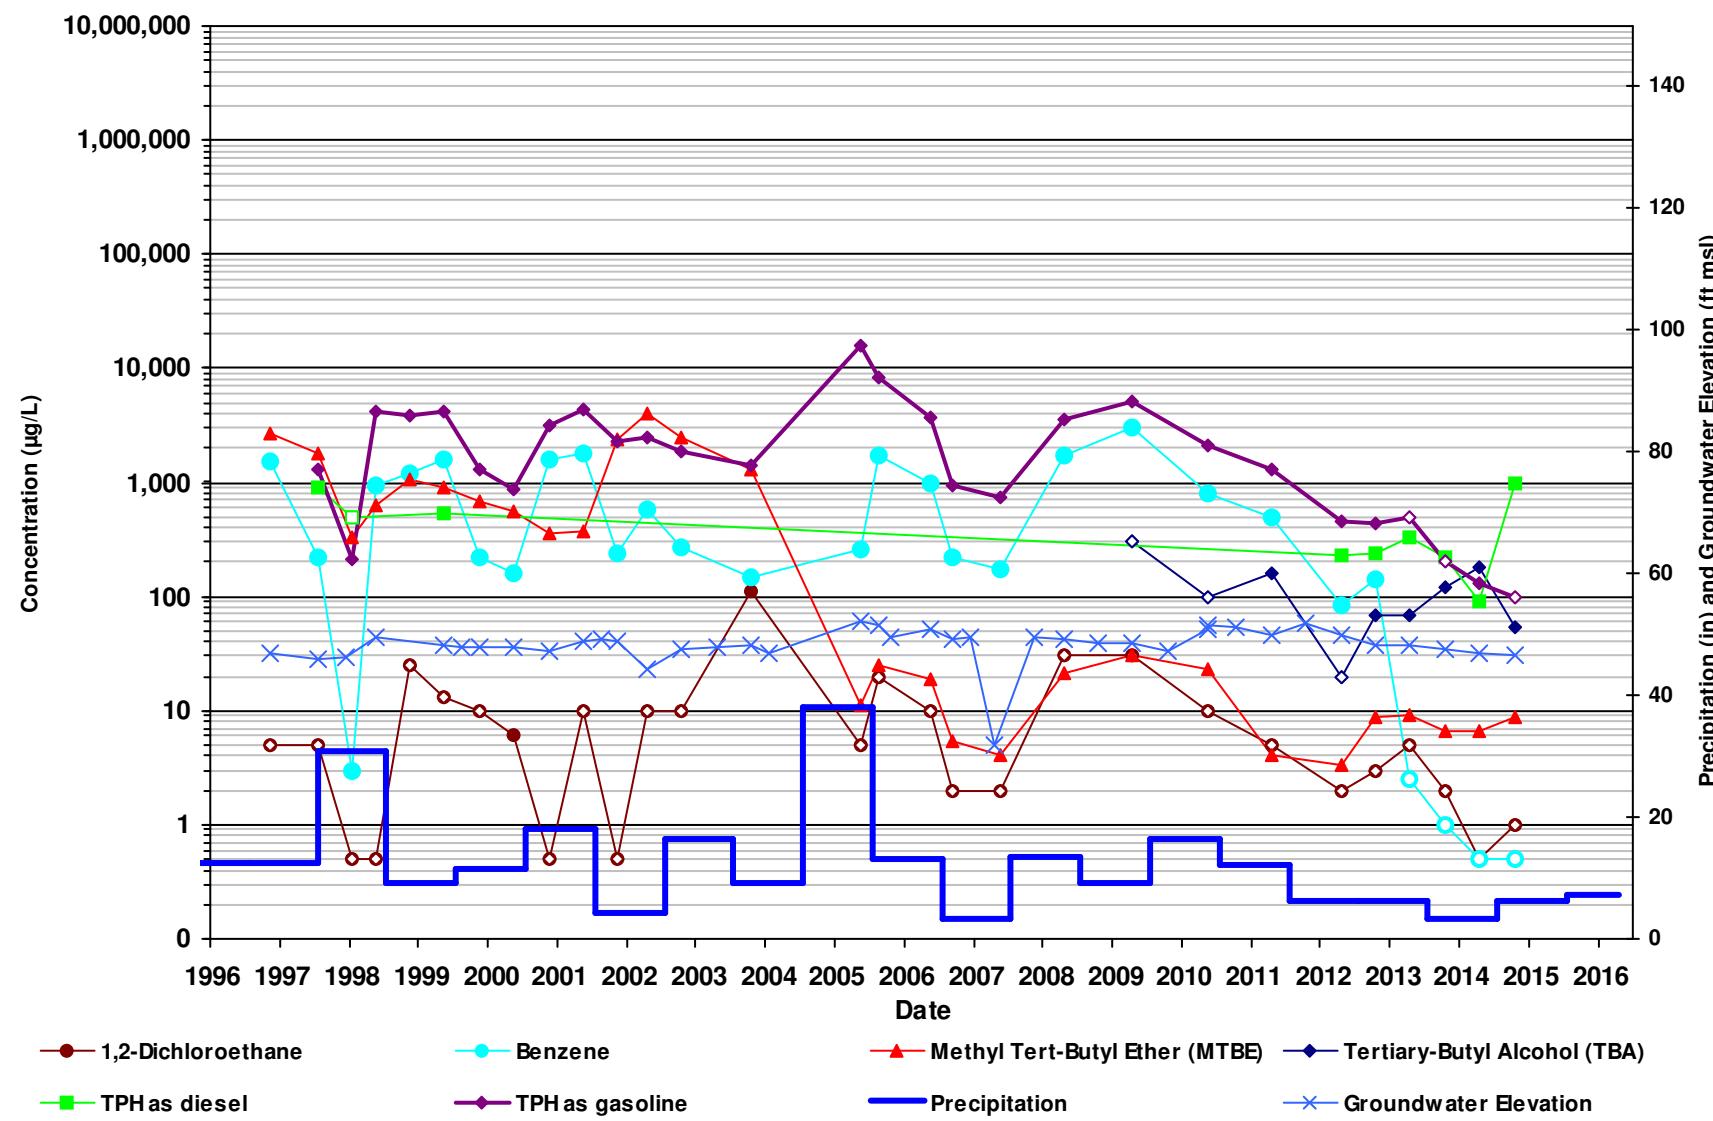

GMW-O-14

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

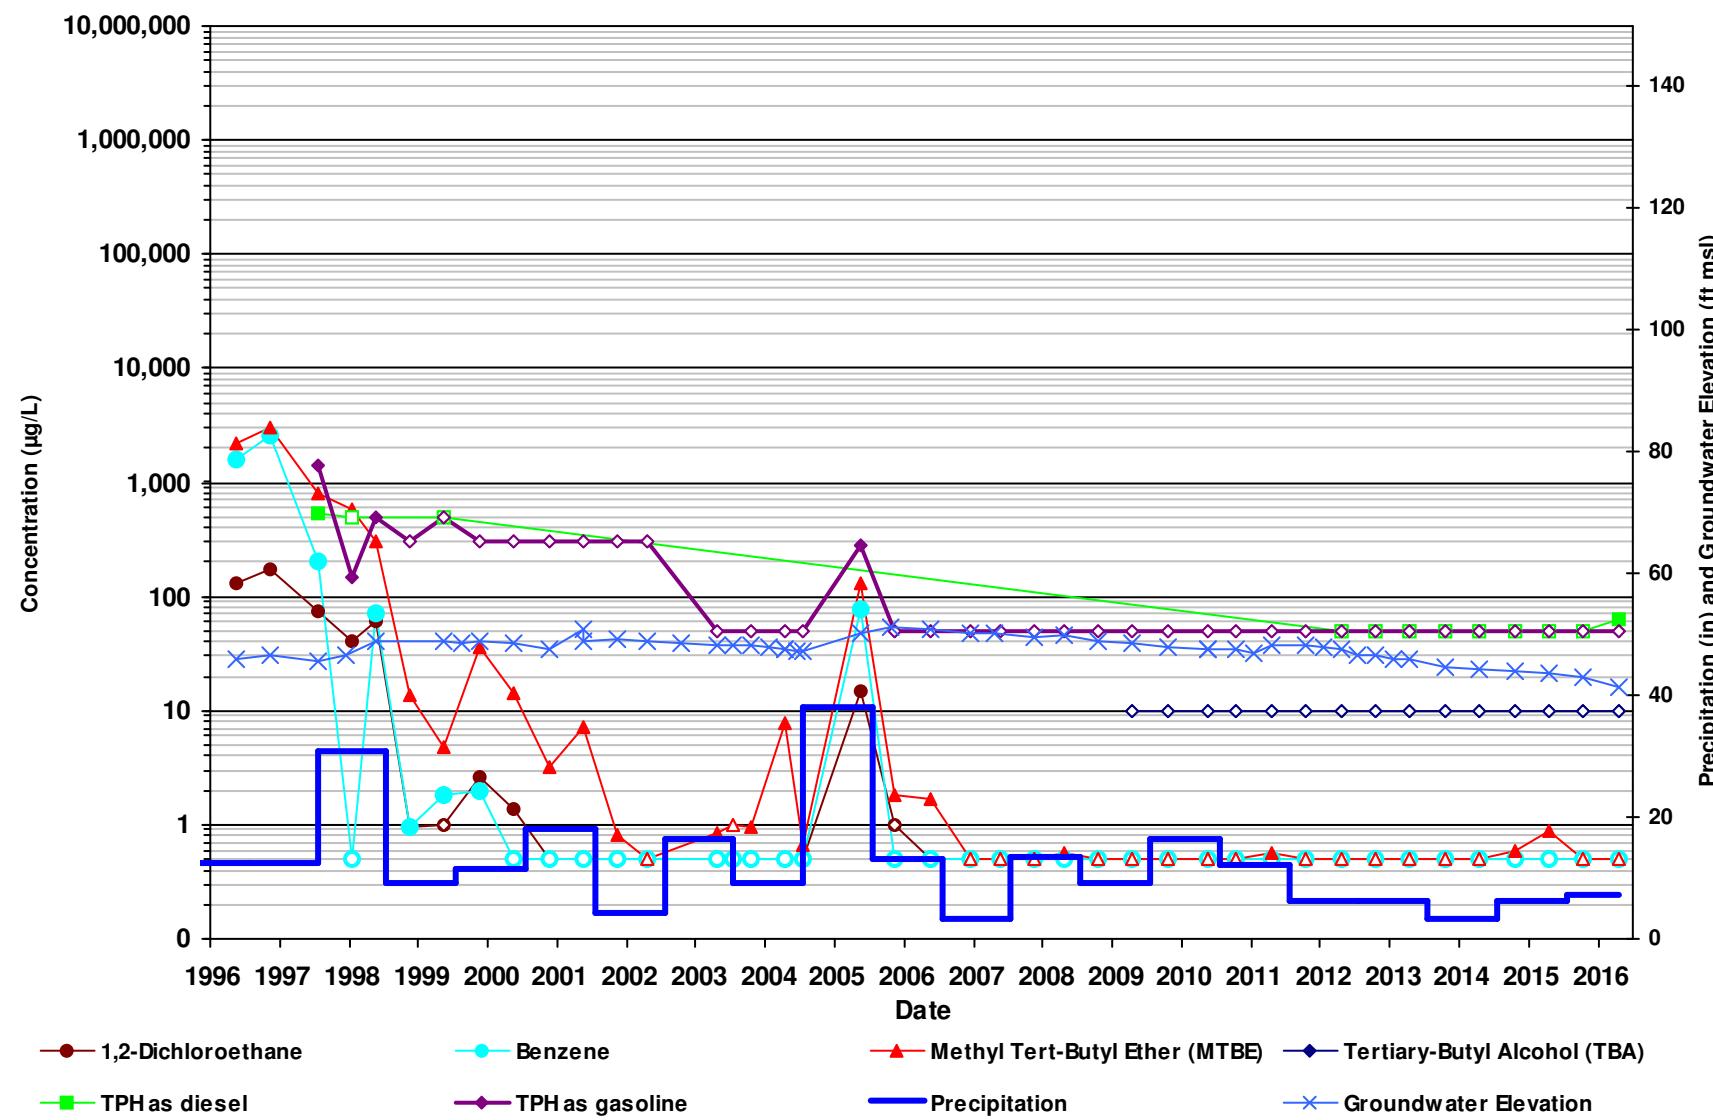

GWR-1

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

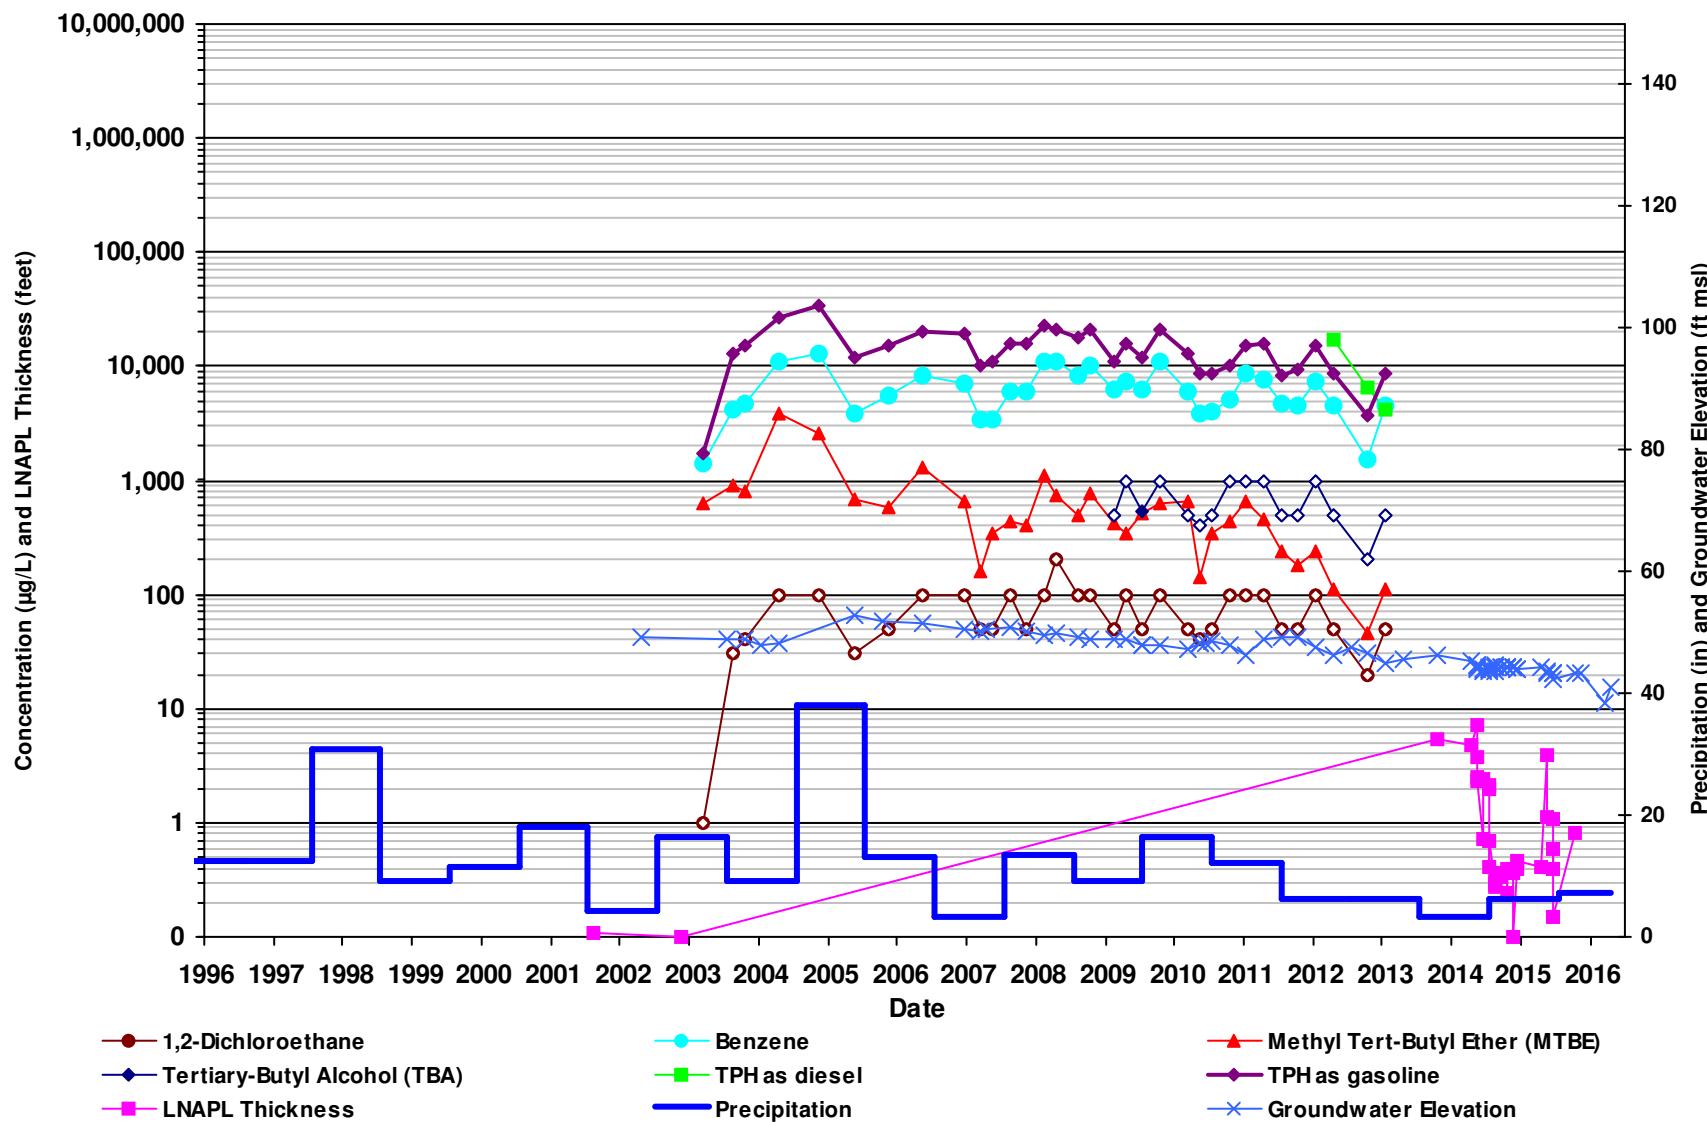

HL-2

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

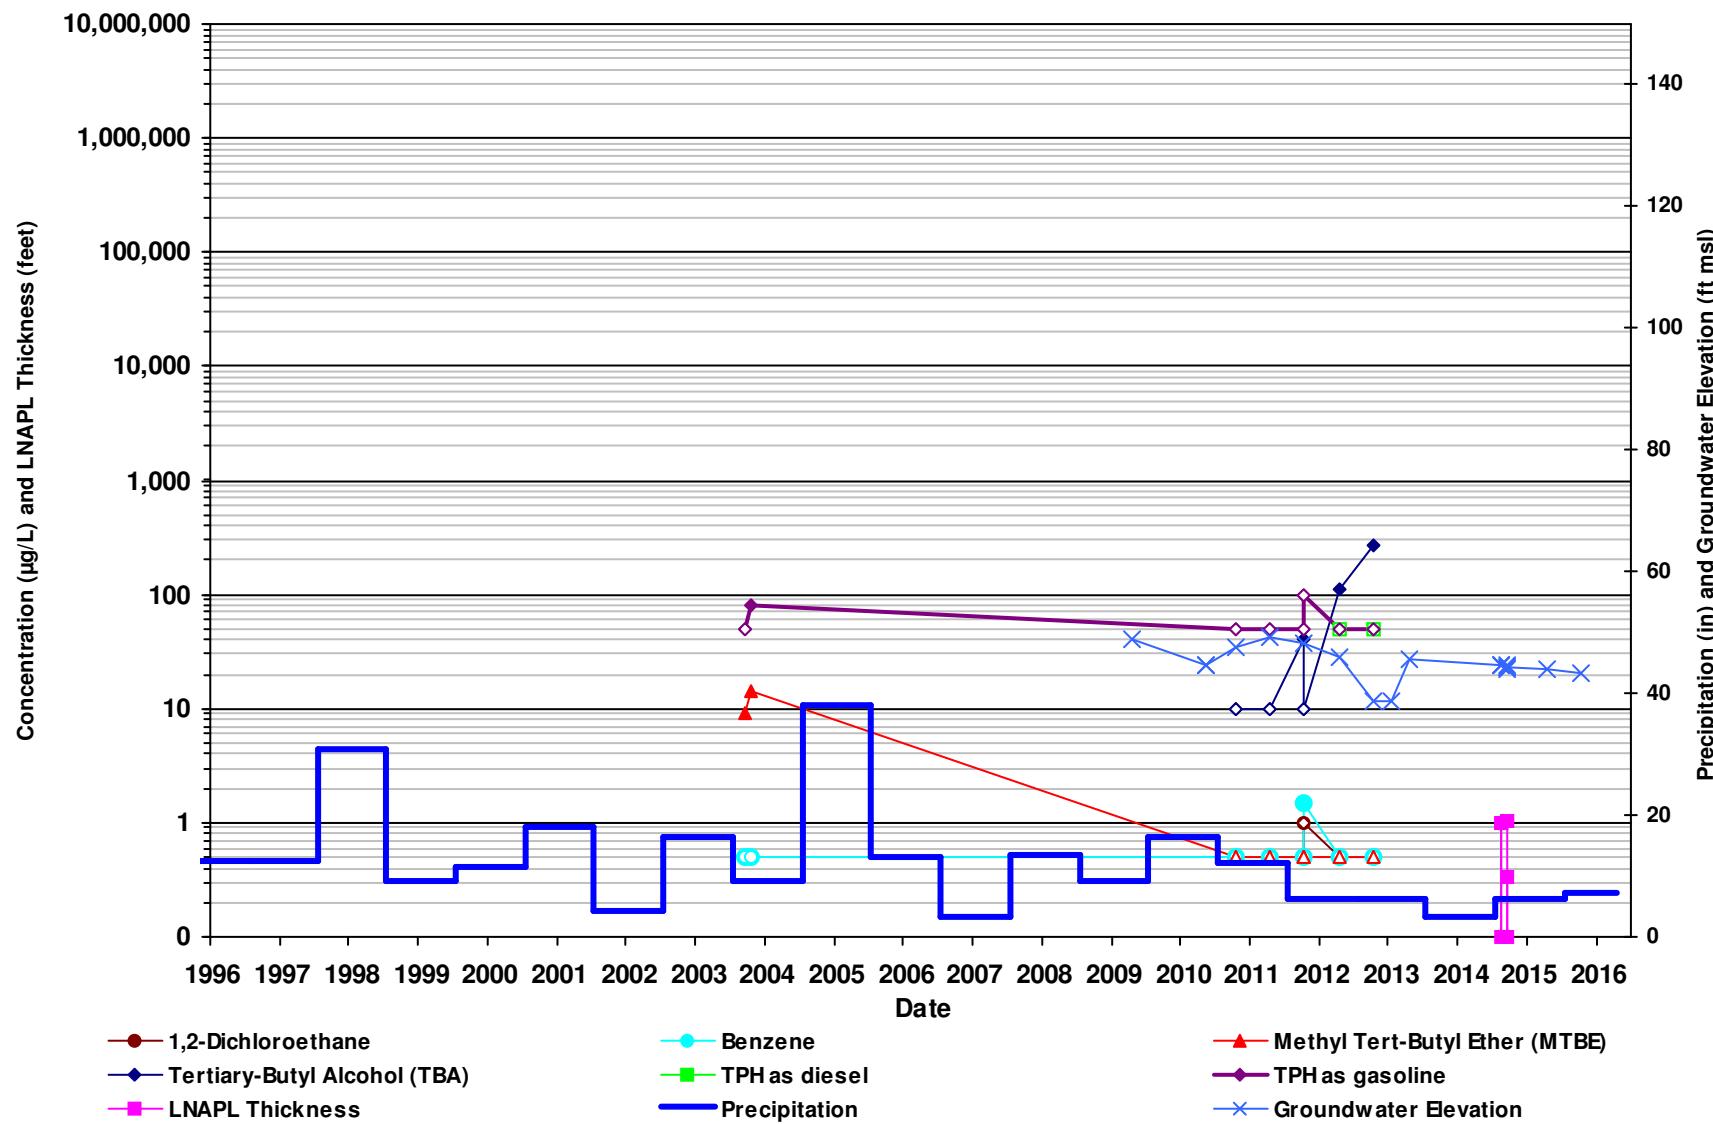

MW-SF-1

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

GMW-SF-9

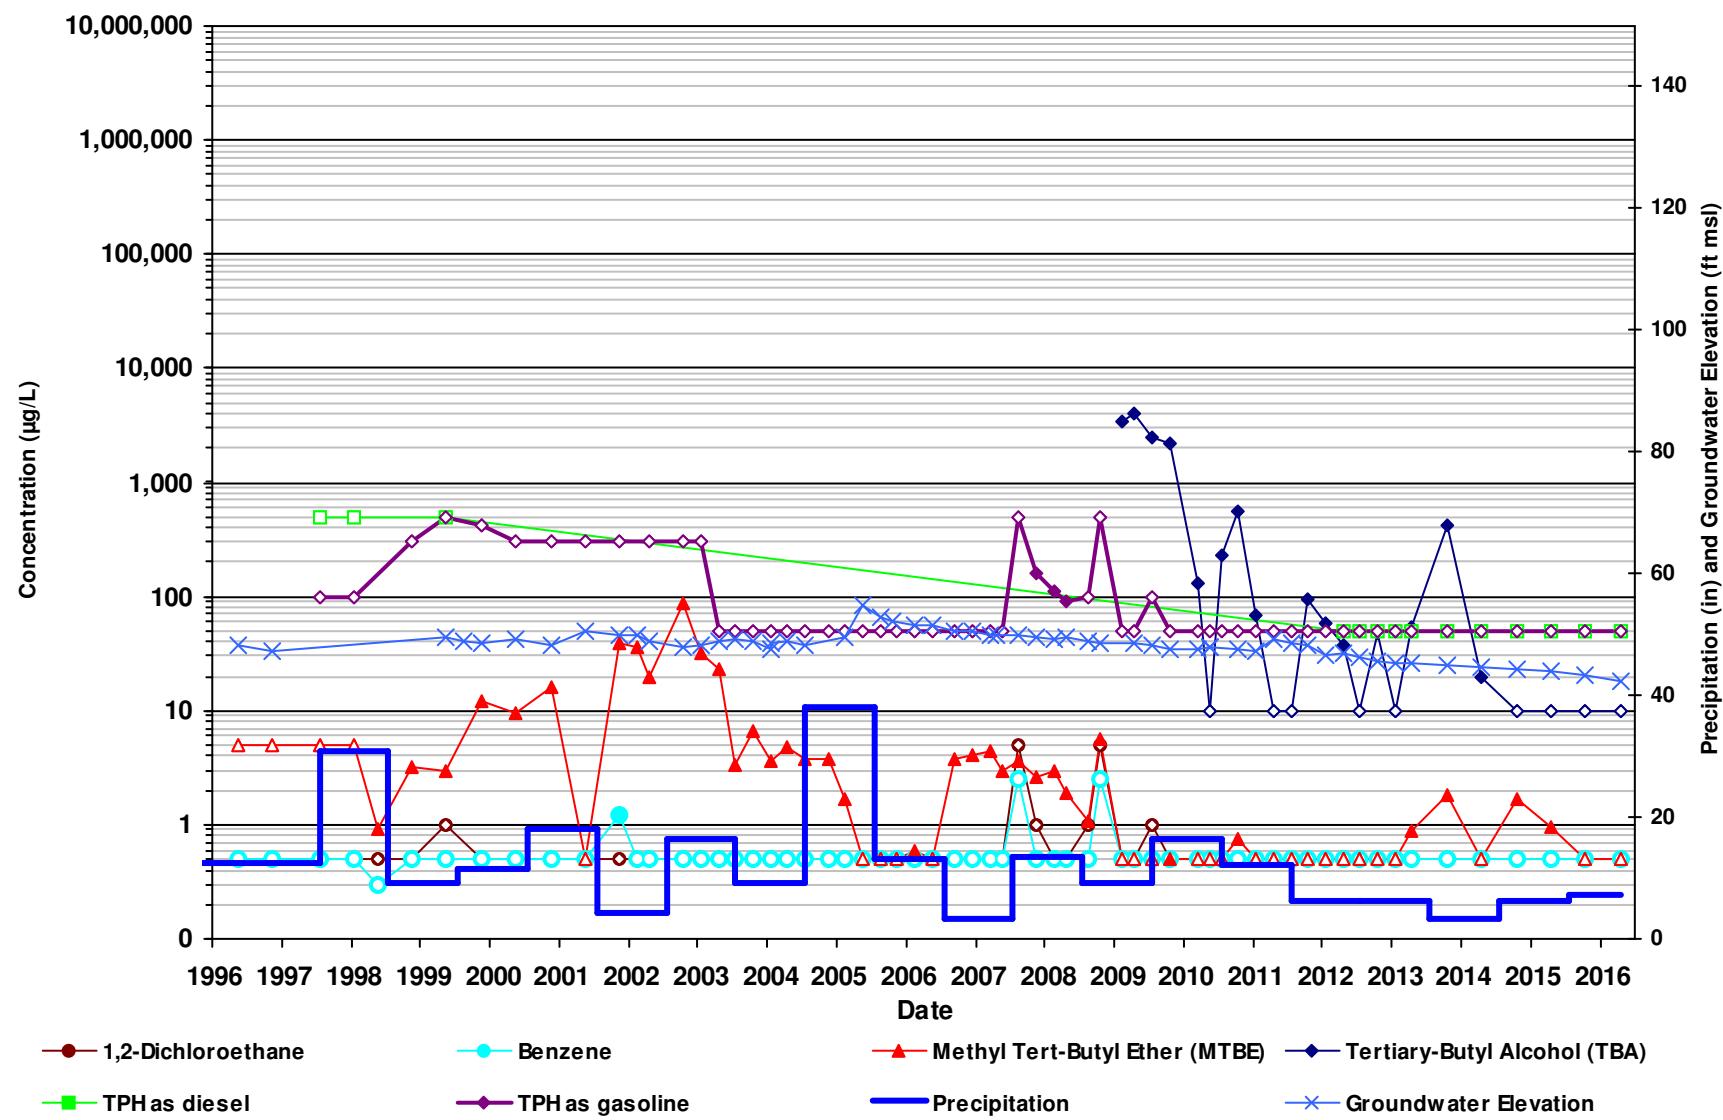

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

Southeastern 24-inch Block Valve Area
GMW-39, GMW-O-18, MW-8, PZ-5

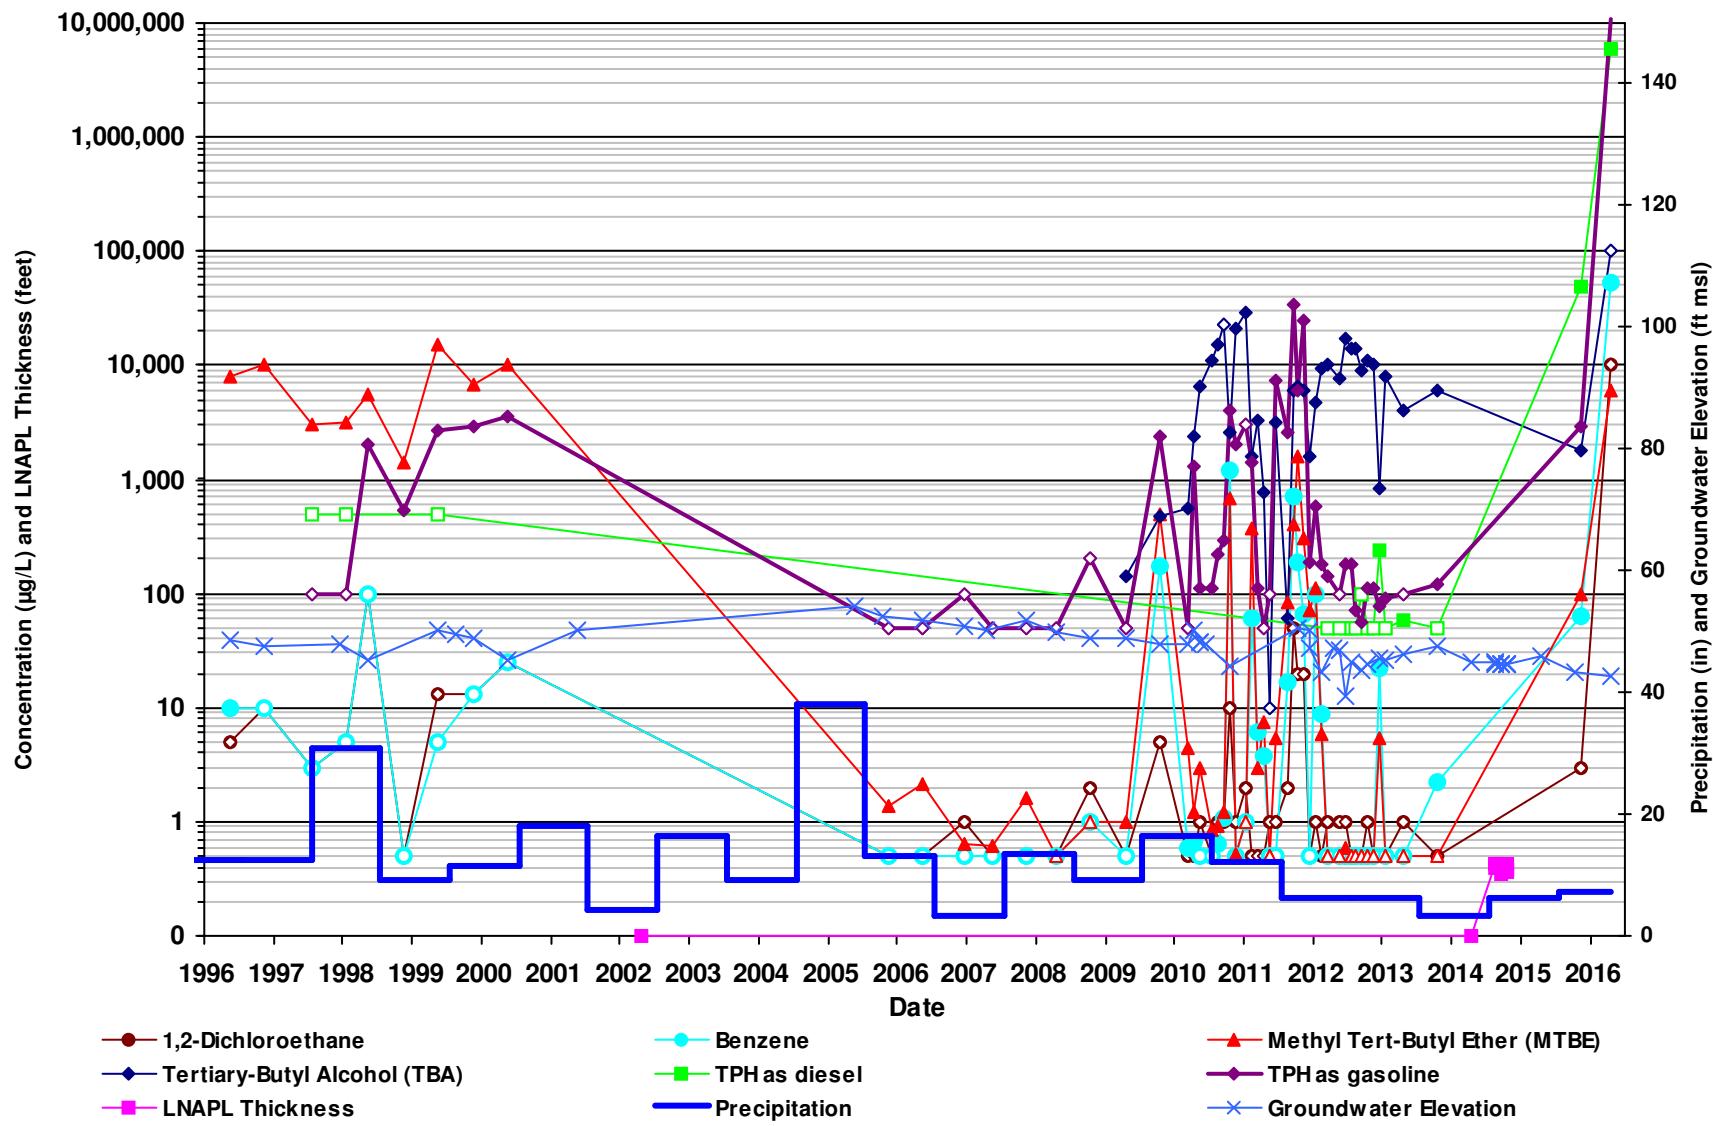

GMW-39

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

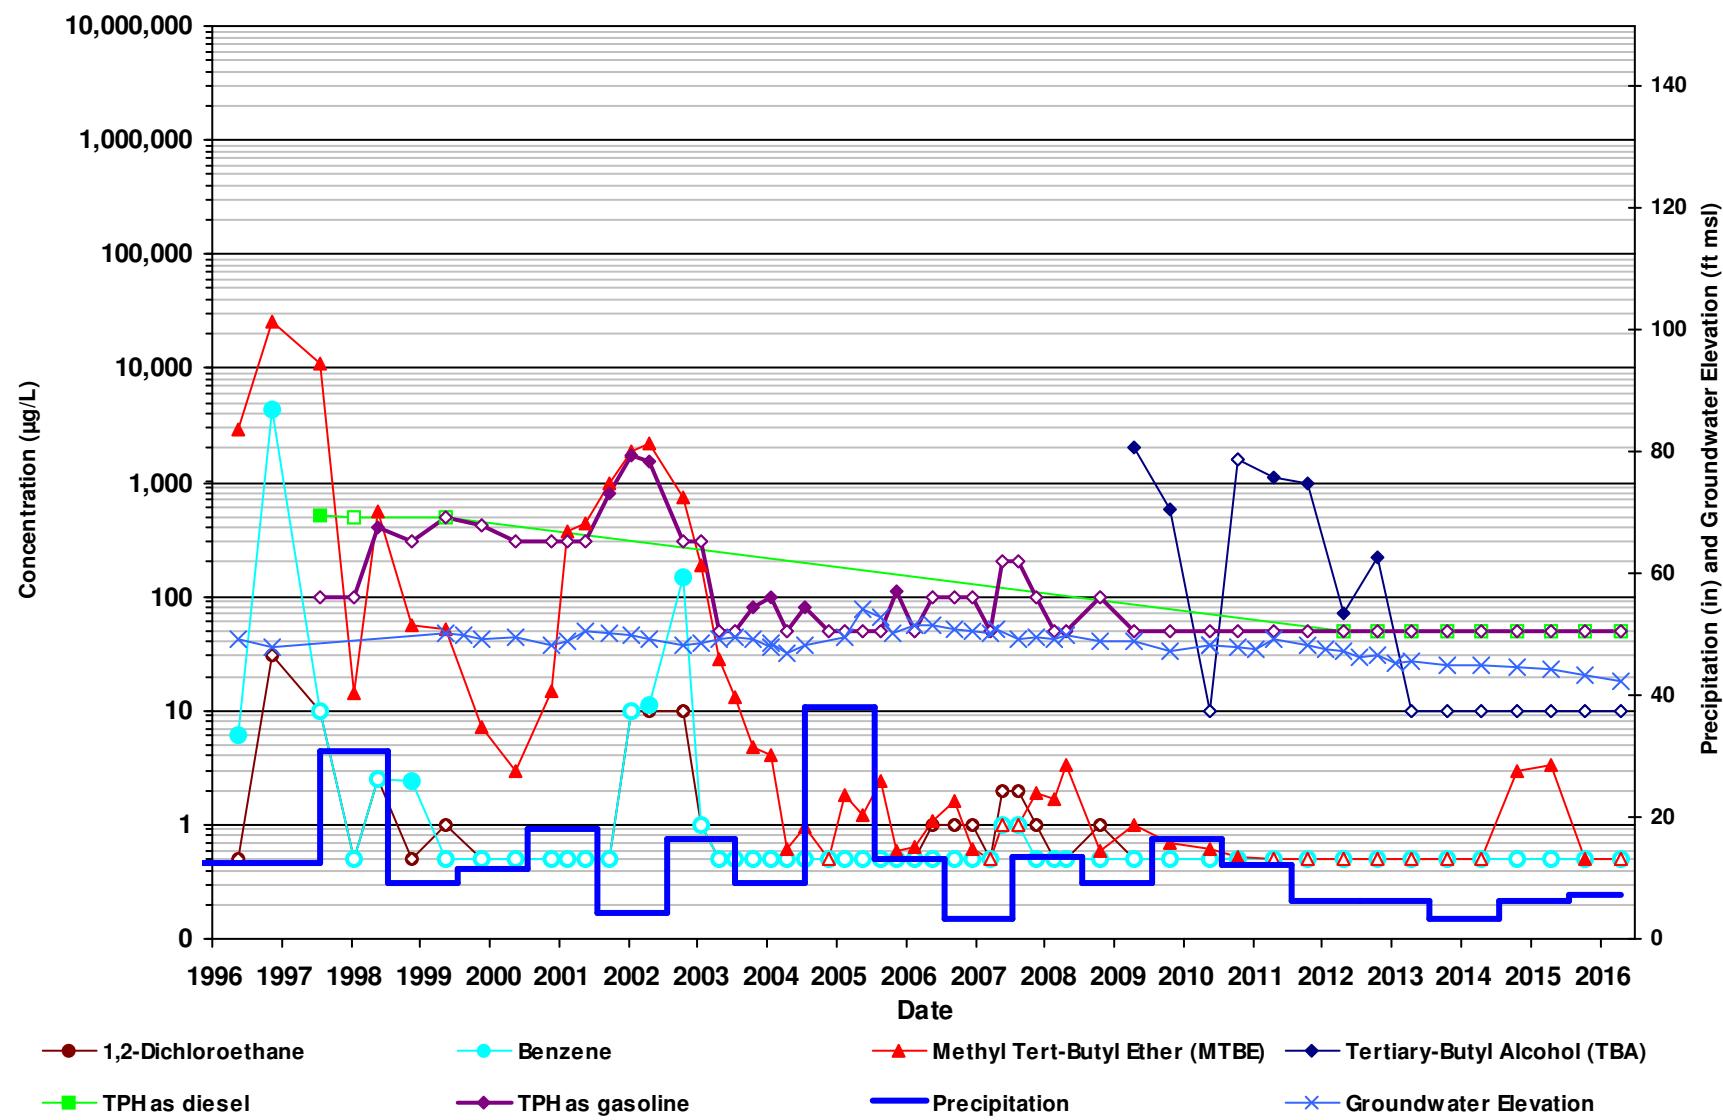

GMW-O-18

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

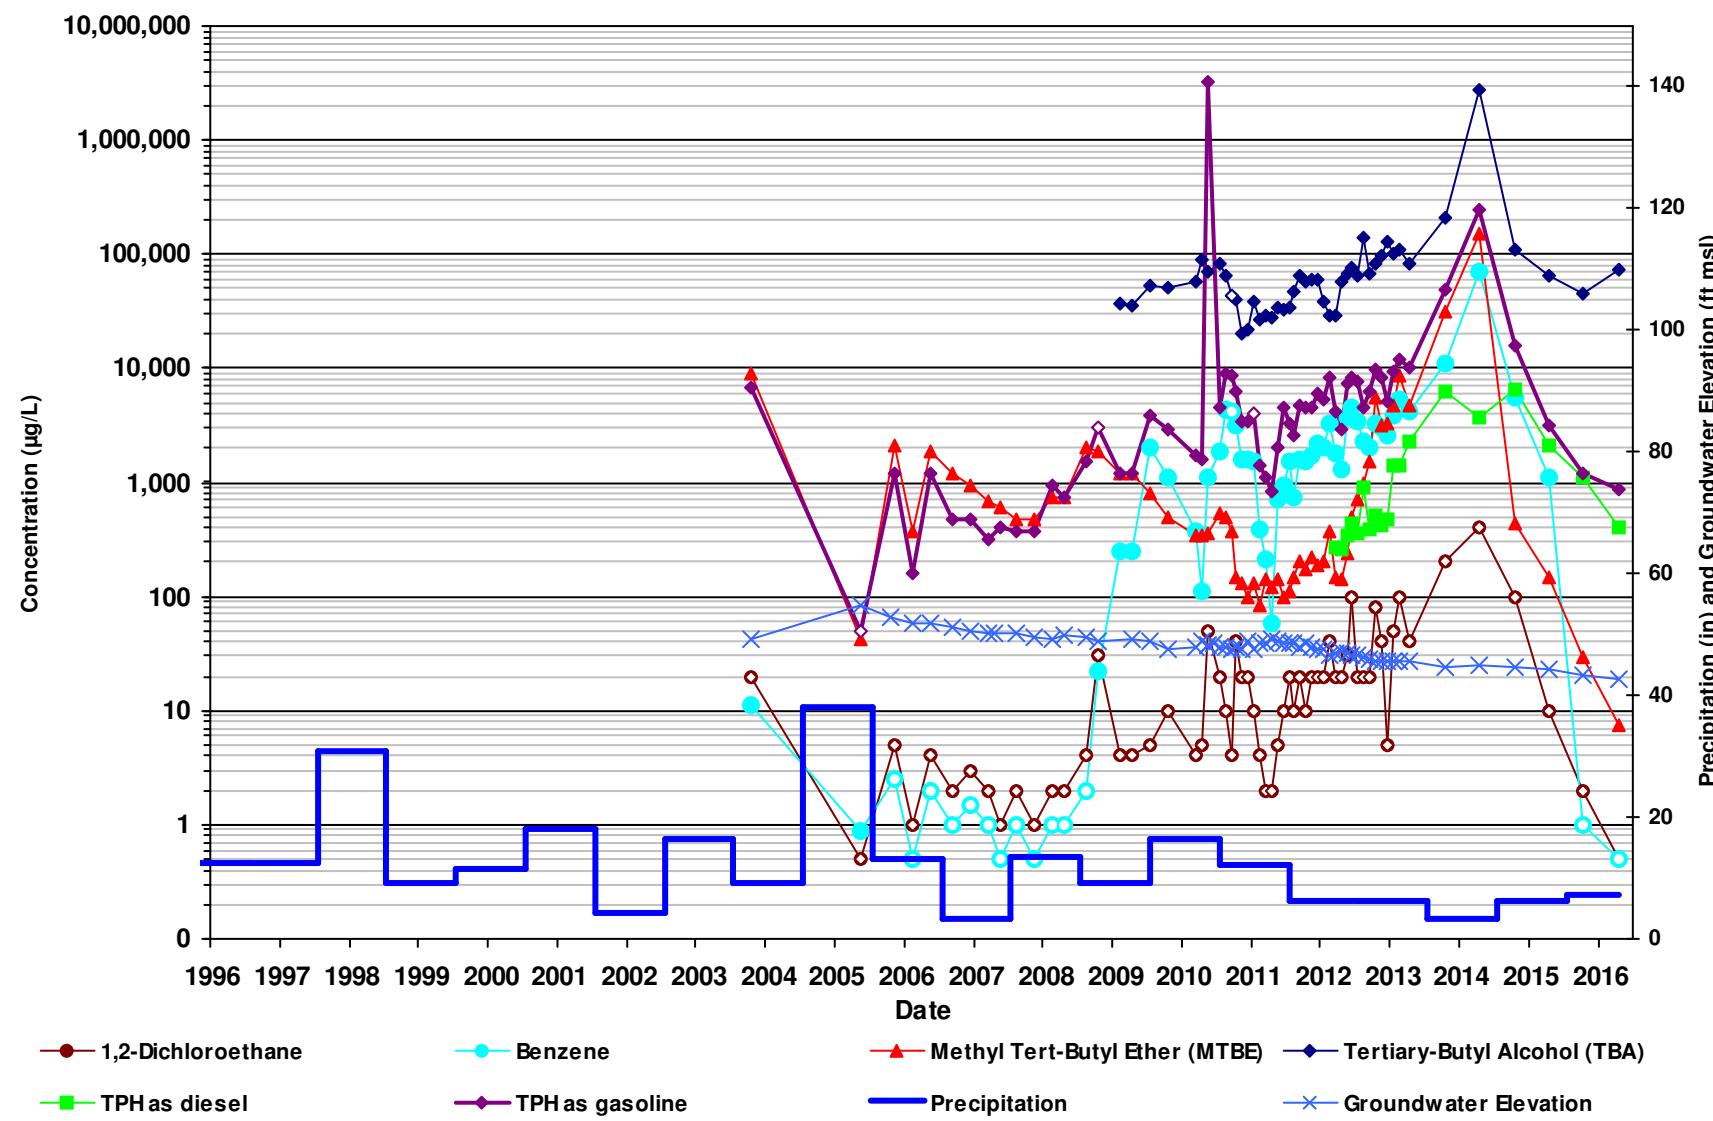

MW-8

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>

PZ-5

Non detect results (ND) are plotted with an open symbol using the laboratory reporting limit.

Precipitation data reported as annual rainfall which is calculated from Long Beach CIMIS #174 weather station. source:
<http://www.ipm.ucdavis.edu/weather/sites/losangeles.html>
